Getting started

This page...

... describes how to install, set up and start using Stash.

If you're upgrading Stash...

... you should read the [Stash upgrade guide](#) instead of this page.

For production installs...

... we highly recommend that you first read [Using Stash in the enterprise](#).

Atlassian Stash is the on-premises Git repository management solution for enterprise teams. It allows everyone in your organization to easily collaborate on your Git repositories. See our [Supported platforms](#) page to find out about system requirements.

1. Install Git

Stash requires Git on the machine that will run Stash. If you need to check, install, or upgrade Git on the Stash server machine, see [Installing and upgrading Git](#).

2. Install Stash

Download and run the Stash installer:

[Download latest version](#) ↗

Installers are available for Linux, Mac OS X and Windows operating systems:

- They install a supported version of Java, if necessary.
- They launch Stash when they finish.

See [Running the Stash installer](#) for details about:

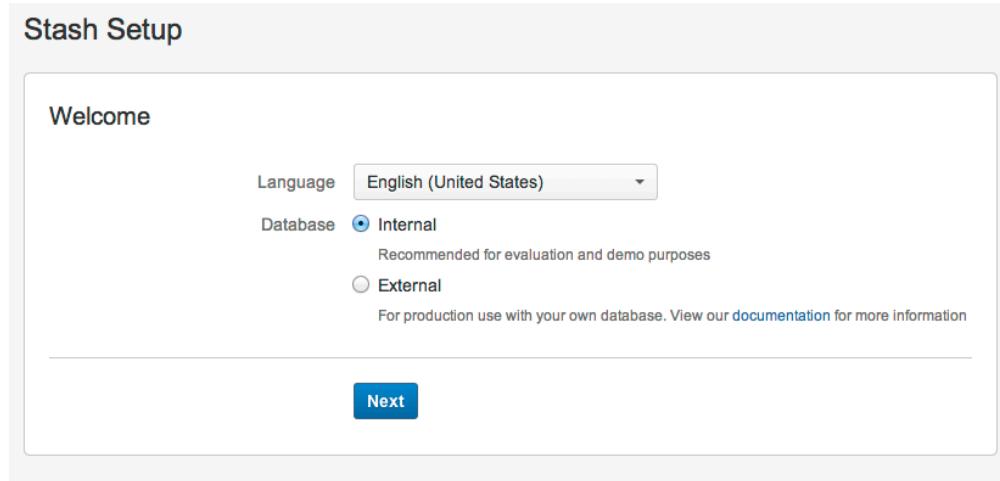

- Installing Stash as a service on Linux and Windows systems.
- Running the installer in a console or in unattended mode.

3. Set up Stash

The Stash Setup Wizard runs automatically when you visit Stash in your browser the first time Stash is started. The Setup Wizard guides you to:

- Specify the default language for Stash.
- [Connect Stash to an external database](#) (the internal HSQL database is great for evaluating Stash, but is not recommended for production installations). You'll need to have created the external database before running the Setup Wizard. For MySQL, you'll need to have [installed the JDBC driver](#) too.

- Enter your Stash license key.
- Set the base URL for Stash.
- Set up an administrator account.
- Integrate Stash with JIRA.
- Log in to Stash.

If you are intending to use Stash for a production installation, see also [Using Stash in the enterprise](#).

4. Set up the mail server

Configuring the Stash email server allows users to receive a link from Stash that lets them generate their own passwords. See [Setting up your mail server](#).

The screenshot shows the 'Mail server configuration' screen. It has a header 'Mail server configuration' and a sub-header 'Mail settings'. Under 'Mail settings', there are fields for 'Hostname*' (smtp.private.atlassian.com), 'Port' (unspecified), 'Username' (unspecified), 'Password' (unspecified), and a checkbox 'Use TLS' (unchecked). There's also a field 'Email from*' (stash-dev@atlassian.com) with a note about specifying the From: header in notification emails. At the bottom of the configuration section are three buttons: 'Save' (blue), 'Delete', and 'Cancel'. Below this is a section titled 'Send a test email' with a 'Recipient' field (unspecified) and a 'Test' button.

5. Get working with Stash

Work with projects

Stash manages related repositories as projects. Find out how to set up projects and give your teams access to those.

If you have existing projects that you want to manage in Stash, then you'll want to read [Importing code from an existing project](#).

Integrate Stash with other Atlassian applications

See [Integrating Stash with Atlassian applications](#) for an overview of what is possible.

As a first step, see [JIRA integration](#) for information about using Stash with JIRA.

If you want to see results from your continuous integration or build server in Stash, see [Bamboo integration](#).

Use Git

We have some information here to help get you up and running with Git:

- [Git Tutorials and Training](#)
- [Basic Git commands](#)
- [Permanently authenticating with Git repositories](#)
- [Using SSH keys to secure Git operations](#)
- [Git resources](#)

Supported platforms

This page lists the supported platforms for **Stash 3.4.x**.

See [Integrating Stash with Atlassian applications](#) for information about supported versions of JIRA.

Hardware requirements

Stash needs a minimum of 720 MB of free memory to start up. Additional memory is required to support Git operations, depending on the number and frequency of Git operations and the number of users. See [Scaling Stash](#) for further discussion of hardware requirements.

Notes:

Deploying multiple Atlassian applications in a single Tomcat container is **not supported**. We do not test this configuration and upgrading any of the applications (even for point releases) is likely to break it.

Finally, we recommend not deploying *any other applications* to the same Tomcat container that runs Stash, especially if these other applications have large memory requirements or require additional libraries in Tomcat's lib subdirectory.

DRAFT - Supported platforms

This page lists the supported platforms for **Stash 3.4.x**.

See [Integrating Stash with Atlassian applications](#) for information about supported versions of JIRA.

Hardware requirements

Stash needs a minimum of 720 MB of free memory to start up. Additional memory is required to support Git operations, depending on the number and frequency of Git operations and the number of users. See [Scaling Stash](#) for further discussion of hardware requirements.

Notes:

Deploying multiple Atlassian applications in a single Tomcat container is **not supported**. We do not test this configuration and upgrading any of the applications (even for point releases) is likely to break it.

Finally, we recommend not deploying *any other applications* to the same Tomcat container that runs Stash, especially if these other applications have large memory requirements or require additional libraries in Tomcat's lib subdirectory.

Using Stash in the enterprise

Atlassian Stash is the Git code management solution for enterprise teams. It allows everyone in your organisation to easily collaborate on your Git repositories, while providing enterprise-grade support for:

- user authentication
- repository security
- integration with your existing databases and development environment.

This page describes best practice for using Stash in enterprise environments, that is with 500+ user licenses. Of course, much of this information is also applicable to other Stash installations.

On this page:

- Platform requirements for hosting Stash
- Performance considerations with Stash
- High availability with Stash
- Setting up Stash in a production environment
- Administering Stash in a production environment

[Watch the movie »](#)

Platform requirements for hosting Stash

Although Stash can be run on Windows, Linux and Mac systems, for enterprise use we only recommend, and support, Linux. This recommendation is based on our own testing and experience with using Stash.

Please see the [Supported platforms](#) page for details of the supported versions of Java, external databases, web browsers and Git.

Performance considerations with Stash

In general, Stash is very stable and has low memory consumption. There are no scalability limits other than for Git hosting operations (clone in particular). We know this is the scalability limit of the product; the limit is proportional to the number of cores on the system.

As an example, data collected from an internal Stash instance indicate that for a team of approximately 50 developers, with associated continuous integration infrastructure, we see a peak concurrency of 30 simultaneous clone operations and a mean of 2 simultaneous clone operations. We conservatively expect that a customer with similar usage patterns would be capable of supporting 1000 users on a machine with 40 cores and a supporting amount of RAM. While we expect a peak concurrency larger than 40, Stash is designed to queue incoming requests so as to avoid overwhelming the server.

Please see [Scaling Stash](#) for more information about Stash performance and hardware requirements.

High availability with Stash

If Stash is a critical part of your development workflow, maximizing Stash availability becomes an important consideration. Please see [High availability for Stash](#) for the background information you need to set up Stash in a highly available configuration.

Setting up Stash in a production environment

When setting up Stash for a production or enterprise environment, we highly recommend that you configure the following aspects:

Run Stash as a dedicated user

- For production environments Stash should be run from a dedicated user account with restricted privileges. See [Running Stash with a dedicated user](#).

Install Stash as a service

- See [Running Stash as a Linux service](#) or [Running Stash as a Windows service](#).

Use an external database

- For production environments Stash should use an external database, rather than the embedded database. Set up your external DBMS (for example MySQL) before starting Stash for the first time. This allows you to connect Stash to that DBMS using the Setup Wizard that launches when you first run Stash. See [Connecting Stash to an external database](#).

Connect to your existing user directory

- Connect Stash to your existing user directory (for example Active Directory). See [External user directories](#)

Secure the Stash home directory

- For production environments the Stash home directory should be secured against unauthorised access. See [Stash home directory](#).

Secure Stash with HTTPS

- Access to Stash should be secured using HTTP over SSL, especially if your data is sensitive and Stash is exposed to the internet. See [Securing Stash with HTTPS](#).

Enable SSH access to Git repositories

- Enable SSH access for your Stash users to Git repositories in Stash so that they can add their own SSH keys to Stash, and then use those SSH keys to secure Git operations between their computer and the Stash server. See [Enabling SSH access to Git repositories in Stash](#).

Change the context path for Stash

- If you are running Stash behind a proxy, or you have another Atlassian application (or any Java web application), available at the same hostname and context path as Stash, then you should set a unique context path for Stash. See [Moving Stash to a different context path](#).

Administering Stash in a production environment

Upgrading Stash

- For production environments we recommend that you test the Stash upgrade on a QA server before deploying to production. See the [Stash upgrade guide](#).

Backups and recovery

- **We highly recommend** that you establish a data recovery plan that is aligned with your company's policies. See [Data recovery and backups](#) for information about tools and backup strategies for Stash.

Logging

- Stash server logs can be found in <STASH_HOME>/log. Logs for the bundled Tomcat webserver can be found in <Stash installation directory>/log. See [Stash debug logging](#).
- Stash displays recent audit events for each repository and project (only visible to Stash admins and system admins), and also creates full audit log files that can be found in the <Stash home directory>/audit/logs directory. Note that Stash has an upper limit to the number of log files it maintains, and deletes the oldest file when a new file is created – we recommend an automated backup of log files. See [Audit logging in Stash](#).

Installing and upgrading Git

This page describes how to:

- Check your version of Git
- Install or upgrade Git on Linux
- Install or upgrade Git on Mac OS X

- [Install or upgrade Git on Windows](#)
- [Restart Stash if necessary](#)

The information on this page applies to installing or upgrading Git on either your local machine, or on the Stash server.

Check your version of Git

The versions of Git supported by Stash are listed on [Supported platforms](#).

You can check your current version of Git by running the `git --version` command in a terminal (Linux, Mac OS X) or command prompt (Windows).

For example:

```
git --version  
git version 1.7.7.3
```

If you don't see a supported version of Git, you'll need to either upgrade Git or perform a fresh install, as described below.

Install or upgrade Git on Linux

Use your package manager to install Git. For example, on Ubuntu 13.10, use:

```
sudo apt-get install git
```

If you are using a different Linux distribution, you may need to use a different package repository to get the latest stable version of Git.

Now [check the Git version](#) – you should see the new version of Git.

If you still can't see the Git version, you may need to add the Git install location to your path. Open your `~/.profile` file in a text editor and add this line, where `<path/to/git>` is the install location for Git:

```
export PATH=$PATH:<path/to/git>
```

You can use the `which git` command to find the install location for Git.

Install or upgrade Git on Mac OS X

Download the latest stable Git release from the [Git website](#). Click on the downloaded .dmg file, then double-click the .pkg icon to run the installer. This will install the new version of Git over the existing version:

Now check the Git version – you should see the new version of Git.

If you still can't see the Git version, you may need to add the Git install location to your path. Open your `~/.profile` file in a text editor and add this line, where `<path/to/git>` is the install location for Git:

```
export PATH=$PATH:<path/to/git>
```

You can use the `which git` command to find the install location for Git.

Install or upgrade Git on Windows

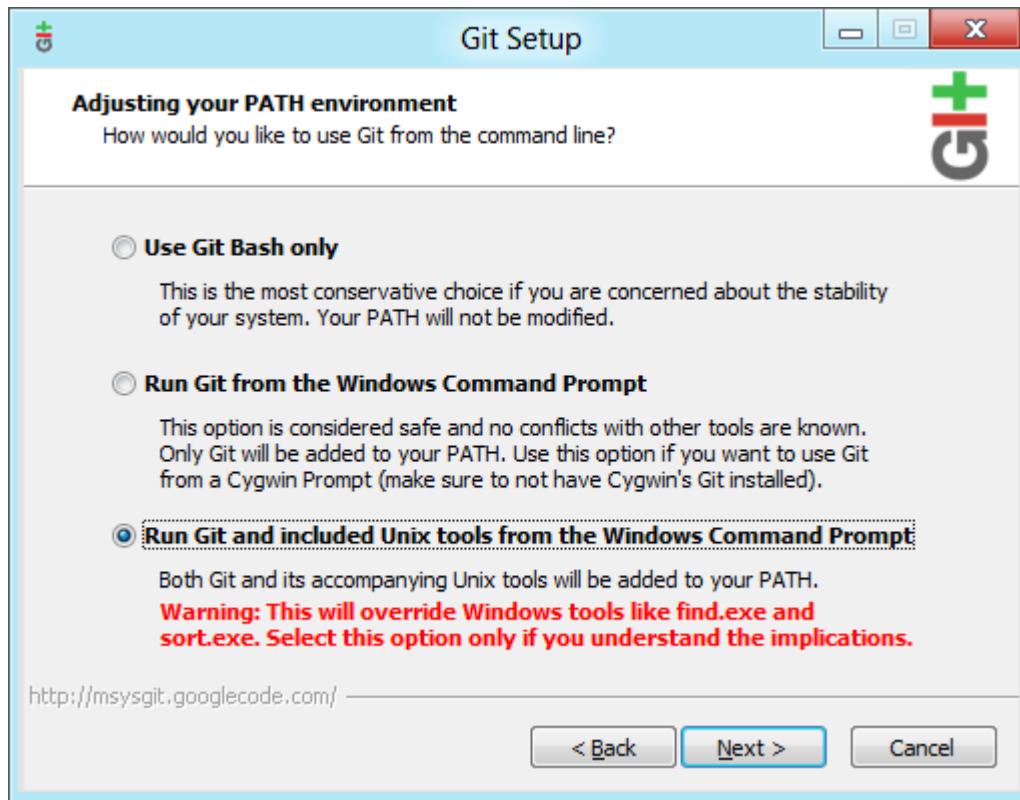

Download the [Full installer for official Git for Windows](#). Installing Git for Windows (msysGit) also installs a supported version of Perl.

! msysGit is the *only supported distribution* when running Stash on Windows. Cygwin Git is *not supported* and has known issues.

Run the Git installer, ensuring that you install into the same location as any existing Git installation. You can use `where git` to locate existing installations.

Ensure that `git.exe` is available in the path:

- Choose either Option 2, "Run Git from the Windows Command Prompt", or Option 3, "Run Git and included Unix tools from the Windows Command Prompt", will both work with Stash.
- Do *not* select Option 1, "Use Git Bash only" when installing or upgrading Git for the Stash server -- *this will not work with Stash*.

Now, check the Git version – you should see the new version of Git.

Restart Stash if necessary

If you've been installing or upgrading Git for the Stash server, rather than for your local machine, you'll need to stop and restart Stash so that it will pick up the upgraded version of Git. See [Starting and stopping Stash](#) for details.

Configuring JIRA integration in the Setup Wizard

This page describes the 'JIRA integration' screen of the Stash Setup Wizard that runs automatically when you launch Stash for the first time.

The Setup Wizard guides you in configuring the Stash connection with JIRA using the most common options. You can also configure JIRA integration from the Stash administration screens at any time after completing the Setup Wizard.

There are two aspects to integrating Stash with JIRA:

- Linking JIRA and Stash to enable the integration features. See [JIRA integration](#).
- Delegating Stash user and group management to your JIRA server. See [Connecting Stash to JIRA for user management](#).

On this page:

- [Connecting to JIRA in the Setup Wizard](#)
- [Troubleshooting](#)
- [Notes](#)

Connecting to JIRA in the Setup Wizard

To configure JIRA integration while running the Stash Setup Wizard:

1. Configure the following setting in JIRA: Allow remote API access.

2. Click **Integrate with JIRA** and enter the following information when you get to the 'Connect to JIRA' step of the setup wizard:

JIRA base URL	The web address of your JIRA server. Examples are: http://www.example.com:8080/jira/ http://jira.example.com
JIRA admin username	The credentials for a user with the 'JIRA System Administrators' global permission in JIRA.
JIRA password	
Stash base URL	JIRA will use this URL to access your Stash server. The URL you give here will override the base URL specified in your Stash administration console, for the purposes of the JIRA connection.

3. Click **Connect**.
 4. Finish the setup process.

JIRA integration

Use JIRA as a central server for user management or connect your issues and changesets simply by adding issue keys to your commit messages.

- Automatically import all your JIRA users.
- See what code changes are related to a specific JIRA issue.
- Quickly navigate to JIRA issues that are linked to commits.
- Keep track of bug-fixes.

Create JIRA connection

JIRA base URL * For example: http://jira.atlassian.com

JIRA administrator username * This user must have system administrator rights in JIRA

JIRA password * The JIRA user's password

Stash base URL * JIRA will access Stash from this URL

Using JIRA as my user database

If you have JIRA 4.3 or later, Stash can use JIRA for user management. This is not recommended for more than 500 users. [Learn more about JIRA user management](#).

Use JIRA as my user database

Connect **Skip**

Troubleshooting

▼ [Click to see troubleshooting information...](#)

This section describes the possible problems that may occur when integrating your application with JIRA via the setup wizard, and the solutions for each problem.

Symptom	Cause	Solution

<p>The setup wizard displays one of the following error messages:</p> <ul style="list-style-type: none"> Failed to create application link from JIRA server at <URL> to this <application> server at <URL>. Failed to create application link from this <application> server at <URL> to JIRA server at <URL>. Failed to authenticate application link from JIRA server at <URL> to this <application> server at <URL>. Failed to authenticate application link from <application> server at <URL> to this JIRA server at <URL>. 	<p>The setup wizard failed to complete registration of the peer-to-peer application link with JIRA. JIRA integration is only partially configured.</p>	<p>Remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup. Detailed instructions are below.</p>
<p>The setup wizard displays one of the following error messages:</p> <ul style="list-style-type: none"> Failed to register <application> configuration in JIRA for shared user management. Received invalid response from JIRA: <response> Failed to register <application> configuration in JIRA for shared user management. Received: <response> 	<p>The setup wizard failed to complete registration of the client-server link with JIRA for user management. The peer-to-peer link was successfully created, but integration is only partially configured.</p>	<p>Remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup. Detailed instructions are below.</p>
<p>The setup wizard displays the following error message:</p> <ul style="list-style-type: none"> Error setting Crowd authentication 	<p>The setup wizard successfully established the peer-to-peer link with JIRA, but could not persist the client-server link for user management in your <code>config.xml</code> file. This may be caused by a problem in your environment, such as a full disk.</p>	<p>Please investigate and fix the problem that prevented the application from saving the configuration file to disk. Then remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup. Detailed instructions are below.</p>
<p>The setup wizard displays the following error message:</p> <ul style="list-style-type: none"> Error reloading Crowd authentication 	<p>The setup wizard has completed the integration of your application with JIRA, but is unable to start synchronizing the JIRA users with your application.</p>	<p>Restart your application. You should then be able to continue with the setup wizard. If this solution does not work, please contact Atlassian Support.</p>
<p>The setup wizard displays the following error message:</p> <ul style="list-style-type: none"> An error occurred: <code>java.lang.IllegalStateException</code>: Could not create the application in JIRA/Crowd (code: 500). Please refer to the logs for details. 	<p>The setup wizard has not completed the integration of your application with JIRA. The links are only partially configured. The problem occurred because there is already a user management configuration in JIRA for this <application> URL.</p>	<p>Remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup. Detailed instructions are below.</p>

No users can log in after you have set up the application with JIRA integration.	<p>Possible causes:</p> <ul style="list-style-type: none"> • There are no users in the group that you specified on the 'Connect to JIRA' screen. • For FishEye: There are no groups specified in the 'groups to synchronize' section of your administration console. • For Stash: You may not have granted any JIRA groups or users permissions to log in to Stash. 	<p>Go to JIRA and add some usernames to the group.</p> <ul style="list-style-type: none"> • For FishEye: Go to the FishEye administration screens and specify at least one group to synchronize. The default is 'jira-users'. • For Stash: Grant the Stash User permission to the relevant JIRA groups on the Stash Global permissions page. <p>If this solution does not work, please contact Atlassian Support.</p>
--	--	---

Solution 1: Removing a Partial Configuration – The Easiest Way

If the application's setup wizard fails part-way through setting up the JIRA integration, you may need to remove the partial configuration from JIRA before continuing with your application setup. Please follow the steps below.

Remove the partial configuration if it exists, try the 'Connect to JIRA' step again, and then continue with the setup wizard:

1. Log in to JIRA as a user with the '**JIRA System Administrators**' global permission.
2. Click the '**Administration**' link on the JIRA top navigation bar.
3. Remove the application link from JIRA, if it exists:
 - a. Click **Application Links** in the JIRA administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
 - b. Look for a link to your application. It will have a base URL of the application linked to JIRA. For example:
 - If you want to remove a link between JIRA and FishEye, look for the one where the **Application URL** matches the base URL of your FishEye server.
 - If you want to remove a link between JIRA and Confluence, look for the one where the **Application URL** matches the base URL of your Confluence server.
 - If you want to remove a link between JIRA and Stash, look for the one where the **Application URL** matches the base URL of your Stash server.
 - c. Click **Delete** next to the application link that you want to delete.
 - d. A confirmation screen will appear. Click **Confirm** to delete the application link.
4. Remove the user management configuration from JIRA, if it exists:
 - a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
 - In JIRA 4.3: Click '**Other Applications**' in the '**Users, Groups & Roles**' section of the JIRA administration screen.
 - In JIRA 4.4: Select '**Administration**' > '**Users**' > '**JIRA User Server**'.
 - b. Look for a link to your application. It will have a name matching this format:

`<Type> - <HostName> - <Application ID>`

For example:

`FishEye / Crucible - localhost - 92004b08-5657-3048-b5dc-f886e662ba15`

Or:

```
Confluence - localhost -
92004b08-5657-3048-b5dc-f886e662ba15
```

If you have multiple servers of the same type running on the same host, you will need to match the application ID of your application with the one shown in JIRA. To find the application ID:

- Go to the following URL in your browser:

```
<baseUrl>/rest/applinks/1.0/manifest
```

Replace `<baseUrl>` with the base URL of your application.

For example:

```
http://localhost:8060/rest/applinks/1.0/manifest
```

- The application links manifest will appear. Check the application ID in the `<id>` element.
 - c. In JIRA, click '**Delete**' next to the application that you want to remove.
5. Go back to the setup wizard and try the 'Connect to JIRA' step again.

Solution 2: Removing a Partial Configuration – The Longer Way

If solution 1 above does not work, you may need to remove the partial configuration and then add the full integration manually. Please follow these steps:

1. Skip the 'Connect to JIRA' step and continue with the setup wizard, to complete the initial configuration of the application.
2. Log in to JIRA as a user with the '**JIRA System Administrators**' global permission.
3. Click the '**Administration**' link on the JIRA top navigation bar.
4. Remove the application link from JIRA, if it exists:
 - a. Click **Application Links** in the JIRA administration menu. The 'Configure Application Links' page will appear, showing the application links that have been set up.
 - b. Look for a link to your application. It will have a base URL of the application linked to JIRA. For example:
 - If you want to remove a link between JIRA and FishEye, look for the one where the **Application URL** matches the base URL of your FishEye server.
 - If you want to remove a link between JIRA and Confluence, look for the one where the **Application URL** matches the base URL of your Confluence server.
 - If you want to remove a link between JIRA and Stash, look for the one where the **Application URL** matches the base URL of your Stash server.
 - c. Click **Delete** next to the application link that you want to delete.
 - d. A confirmation screen will appear. Click **Confirm** to delete the application link.
5. Remove the user management configuration from JIRA, if it exists:
 - a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
 - In JIRA 4.3: Click '**Other Applications**' in the '**Users, Groups & Roles**' section of the JIRA administration screen.
 - In JIRA 4.4: Select '**Administration** > **Users** > **JIRA User Server**'.
 - b. Look for a link to your application. It will have a name matching this format:

```
<Type> - <HostName> - <Application ID>
```

For example:

```
FishEye / Crucible - localhost -
92004b08-5657-3048-b5dc-f886e662ba15
```

Or:

```
Confluence - localhost -
92004b08-5657-3048-b5dc-f886e662ba15
```

If you have multiple servers of the same type running on the same host, you will need to match the application ID of your application with the one shown in JIRA. To find the application ID:

- Go to the following URL in your browser:

```
<baseUrl>/rest/applinks/1.0/manifest
```

Replace `<baseUrl>` with the base URL of your application.

For example:

```
http://localhost:8060/rest/applinks/1.0/manifest
```

- The application links manifest will appear. Check the application ID in the `<id>` element.
- c. In JIRA, click '**Delete**' next to the application that you want to remove.
6. Add the application link in JIRA again, so that you now have a two-way trusted link between JIRA and your application:
 - a. Click **Add Application Link**. Step 1 of the link wizard will appear.
 - b. Enter the **server URL** of the application that you want to link to (the 'remote application').
 - c. Click **Next**.
 - d. Enter the following information:
 - **Create a link back to this server** – Check to add a two-way link between the two applications.
 - **Username and Password** – Enter the credentials for a username that has administrator access to the remote application.
Note: These credentials are only used to authenticate you to the remote application, so that Application Links can make the changes required for the new link. The credentials are not saved.
 - **Reciprocal Link URL** – The URL you give here will override the base URL specified in your remote application's administration console, for the purposes of the application links connection. Application Links will use this URL to access the remote application.
 - e. Click **Next**.
 - f. Enter the information required to configure authentication for your application link:
 - **The servers have the same set of users** – Check this box, because the users are the same in both applications.
 - **These servers fully trust each other** – Check this box, because you trust the code in both applications and are sure both applications will maintain the security of their private keys.
For more information about configuring authentication, see [Configuring Authentication for an Application Link](#).
 - g. Click **Create**.
 7. Configure a new connection for user management in JIRA:
 - a. Go to the JIRA administration screen for configuring the applications that have been set up to use JIRA for user management:
 - In JIRA 4.3: Click '**Other Applications**' in the '**Users, Groups & Roles**' section of the JIRA administration screen.
 - In JIRA 4.4: Select '**Administration**' > '**Users**' > '**JIRA User Server**'.
 - b. **Add** an application.
 - c. Enter the **application name** and **password** that your application will use when accessing JIRA.

- d. Enter the **IP address** or addresses of your application. Valid values are:
 - A full IP address, e.g. 192.168.10.12.
 - A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to [CIDR notation on Wikipedia](#) and [RFC 4632](#).
 - **Save** the new application.
- 8. Set up the JIRA user directory in the application.
 - For Confluence:
 - a. Go to the **Confluence Administration Console**.
 - b. Click '**User Directories**' in the left-hand panel.
 - c. **Add** a directory and select type '**Atlassian JIRA**'.
 - d. Enter the following information:
 - **Name** – Enter the name of your JIRA server.
 - **Server URL** – Enter web address of your JIRA server. Examples:

`http://www.example.com:8080/jira/`
`http://jira.example.com`
 - e. Save the directory settings.
 - f. Define the **directory order** by clicking the blue up- and down-arrows next to each directory on the '**User Directories**' screen.
 For details see [Connecting to Crowd or JIRA for User Management](#).
- For FishEye/Crucible:
 - a. Click **Authentication** (under 'Security Settings').
 - b. Click **Setup JIRA/Crowd authentication**. Note, if LDAP authentication has already been set up, you will need to remove that before connecting to JIRA for user management.
 - c. Make the following settings:

Authenticate against	Select a JIRA instance
Application name and password	Enter the values that you defined for your application in the settings on JIRA.
JIRA URL	The web address of your JIRA server. Examples: <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p><code>http://www.example.com:8080/jira/</code> <code>http://jira.example.com</code></p> </div>
Auto-add	Select Create a FishEye user on successful login so that your JIRA users will be automatically added as a FishEye user when they first log in.
Periodically synchronise users with JIRA	Select Yes to ensure that JIRA will synchronize all changes in the user information on a regular basis. Change the value for Synchronise Period if required.
When Synchronisation Happens	Select an option depending on whether you want to allow changes to user attributes from within FishEye.
Single Sign On	Select Disabled . SSO is not available when using JIRA for user management and if enabled will make the integration fail.

- d. Click **Next** and select at least one user group to be synchronised from JIRA. If necessary, you could create a new group in JIRA, such as 'fisheye-users', and select this group here.
 - e. Click **Save**.
- For Stash:
 - a. Go to the Stash administration area.
 - b. Click **User Directories** in the left-hand panel.
 - c. **Add** a directory and select type **Atlassian JIRA**.
 - d. Enter the following information:
 - **Name** – Enter the name of your JIRA server.
 - **Server URL** – Enter web address of your JIRA server. Examples:

```
http://www.example.com:8080/jira/  
http://jira.example.com
```

- **Application name and Application password** – Enter the values that you defined for Stash in the settings on JIRA.
- e. Save the directory settings.
- f. Define the directory order by clicking the blue up- and down-arrows next to each directory on the 'User Directories' screen.

For details see [Connecting Stash to JIRA for user management](#).

Notes

When you connect to JIRA in the setup wizard, the setup procedure will configure *OAuth authentication* between Stash and JIRA. See [Configuring OAuth Authentication for an Application Link](#) for more information.

Getting started with Git and Stash

Atlassian Stash is the Git repository management solution for enterprise teams. It allows everyone in your organisation to easily collaborate on your Git repositories.

This page will guide you through the basics of Stash. By the end you should know how to:

- Create accounts for your collaborators, and organize these into groups with permissions.
- Create a project and set up permissions.
- Create repositories, and know the basic commands for interacting with them.

Assumptions

This guide assumes that you don't have prior experience with Git. But we do assume that:

- You have Git version 1.7.6 or higher installed on your local computer.
- You are using a [supported browser](#).
- You have Stash installed and running. If you haven't, see [Getting started](#).

Please read [Git resources](#) or check out our [Git tutorials](#) for tips on getting started with Git.

Add users to Stash and grant permissions

The first thing you can do in Stash is to add collaborators.

Go to the Stash administration area, by clicking the 'cog' menu in the header, and then click **Users** (under 'Accounts'):

The screenshot shows the Stash 3.4 Administration interface. At the top, there's a navigation bar with links for 'Projects' and 'Repositories'. On the right side of the top bar, there are icons for 'Give Feedback', a help icon, a gear icon (highlighted with a red arrow), and a user profile picture. Below the top bar, the main content area has a header 'Administration'. On the left, a sidebar has two sections: 'ACCOUNTS' (with 'Users', 'Groups', 'Global permissions', 'Authentication', 'Avatars', and 'User Directories') and 'SETTINGS' (with 'Server settings'). The central area is divided into 'Accounts' and 'Settings'. The 'Accounts' section contains links for 'Users', 'Groups', 'Global permissions', and 'Authentication'. The 'Settings' section contains links for 'Server settings', 'Database', 'Application Navigator', and 'Application Links'. Each link has a brief description below it.

Click **Create user** to go directly to the user creation form:

The screenshot shows the 'Create User' form. It has three text input fields: 'Username' (with a red asterisk), 'Full name' (with a red asterisk), and 'Email address' (with a red asterisk). Below these fields is a checkbox labeled 'Email a link to the user to set their password'. At the bottom of the form are two buttons: a blue 'Create user' button and a white 'Cancel' button.

Once you've created a user, click **Change permissions** to set up their access permissions:

[← Back to Users](#)

The screenshot shows the user profile page for 'John Does'. At the top, there are three buttons: 'Edit', 'Change password', and 'Delete'. Below these is a placeholder for an avatar, with the text 'Change your avatar with Gravatar'. To the right of the placeholder are the user's details: 'John Does', a profile icon, 'jdoes', and 'john@does.com'. A 'STASH USER' badge is next to a 'Change permissions' button, which is highlighted with a large red arrow pointing towards it. Below this section is a navigation bar with 'Groups', 'Achievements', and 'SSH keys'. Under 'Groups', the 'stash-users' group is listed. The entire interface has a clean, modern design with a light gray background.

There are 4 levels of user authentication:

- **System Administrator** — can access all the configuration settings of the Stash instance.
- **Administrator** — same as System Admins, but they can't modify file paths or the Stash server settings.
- **Project Creator** — can create, modify and delete projects.
- **Stash User** — active users who can access Stash.

See [Users and groups](#) for more information about authentication.

See [External user directories](#) if you have existing user identities you wish to use with Stash.

Create your first project and share it with collaborators

Creating your project

The next thing you do in Stash is to create a project. You'll add repositories to this project later.

Simply go to 'Projects' and click **Create project**. (Initially, you won't see as many projects as shown in this screenshot.)

The screenshot shows the Stash interface with the 'Projects' tab selected. A red arrow points to the 'Create project' button, which is highlighted with a white border. Below the button is a table listing five existing projects: 'Angry Nerds' (key AN), 'Blitz' (key BLTZ), 'DEVREL' (key DEV), 'Empty Project' (key EP), and 'External Open Source' (key EXTOS). Each row includes a small icon and a brief description.

Project	Key	Description
Angry Nerds	AN	Angry Nerds Project
Blitz	BLTZ	For Blitz testing
DEVREL	DEV	No description
Empty Project	EP	For testing with an empty project.
External Open Source	EXTOS	Project for holding external open so

Complete the form and submit it to create your new project:

The dialog box has a title 'Create a Project'. It contains fields for 'Project name' (value: 'Angry Nerds Mobile'), 'Project key' (value: 'ANM'), and 'Description' (value: 'Spiking the mobile version of Angry Nerds.'). There is also a 'Project Avatar' section with a placeholder image and a 'Change avatar' button. At the bottom are 'Create project' and 'Cancel' buttons.

Project name *	Angry Nerds Mobile
Project key *	ANM
Eg. AT (for a project named Atlassian)	
Description	Spiking the mobile version of Angry Nerds.
Project Avatar	Change avatar
Create project Cancel	

See [Creating projects](#) for more information.

Opening up project access to others

If you are a project administrator, you can grant project permissions to other collaborators.

Click **Settings** then **Permissions** for the project:

The 'Project permissions' page allows you to add users and groups to a project you've already created.

There are 3 levels of project access:

- **Admin** — can create, edit and delete repositories and projects, and configure permissions for projects.
- **Write** — can push to and pull from all the repositories in the project.
- **Read** — can only browse code and comments in, and pull from, the repositories in the project.

See [Using project permissions](#) for more information.

Create a repository and get your code into Stash

Create a repository

If you are a project administrator, you can create repositories in the project.

Once a repository is created, the project permissions are applied to the repository. That means all repositories created in a project share the same access and permission settings. If you already have a Git project you'd like to use, see [Importing code from an existing project](#).

Click **Create repository** to open the repository creation form:

ACTIONS

+ [Create repository](#)

Once submitted you will be taken directly to your repository homepage. As there is no content in your repository yet, you'll see some instructions to help you push code to your repository.

See [Creating repositories](#) for more information.

A simple clone and push

This section describes how to [clone](#) the repository you just created and then [push a commit](#) back to it. You can

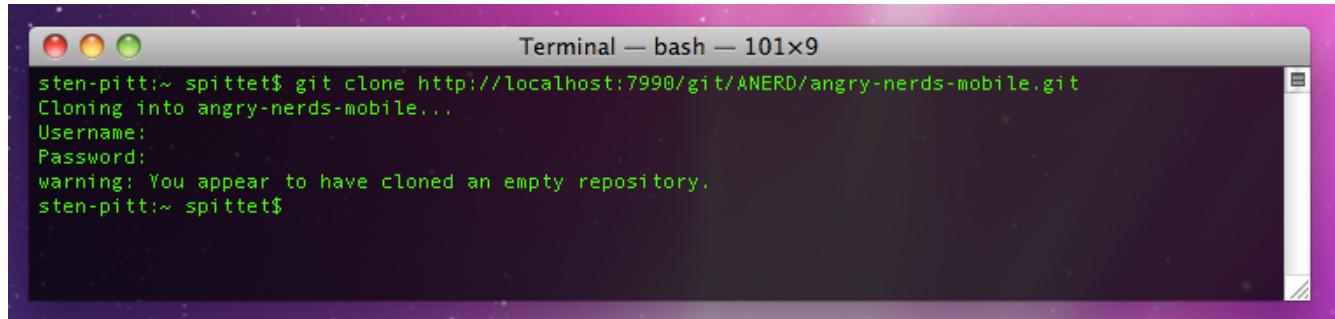

see the clone URL to use at the top right of the screen. SSH access may be available.

In a terminal, run the following command (replace <stashURL> with the URL for your instance of Stash):

```
git clone <stashURL>/git/<projectname>/<reponame>.git
```

Use your Stash username and password.

The result in your terminal should be similar to what you can see in the screenshot below.

You should now have a new empty directory tracked by Git, in the user space of your local machine. Let's add some content and push it back to Stash.

In your <reponame> directory, create a text file named helloworld.txt and write "Hello World" in it.

Now run the following command in your terminal

```
cd <reponame>
git add .
git commit -m "My first commit"
git push origin master
```

If everything went fine, when you refresh the Stash screen, you will see that the homepage of your repository has been replaced with a file browser showing you a link to helloworld.txt.

There you go, you're ready to get coding with your collaborators.

For more information about getting your code into Stash, see [Importing code from an existing project](#). Note that huge Git repositories (larger than a few GBs) are likely to impact the performance of the Git client – see [this discussion](#).

Check out our [Git tutorials and training](#) for more information, and have a look at this list of [basic Git commands](#) that you will probably use often.

Importing code from an existing project

When creating a new repository, you can import code from an existing project into Stash. You can do this by first cloning the repository to your local system and then pushing to an empty Stash repository.

On this page:

- Import an existing, unversioned code project into Stash
- Import an existing Git project into Stash
- Mirror an existing Git repository

Import an existing, unversioned code project into Stash

If you have code on your local machine that is not under source control, you can put it under source control and import it into Stash.

Assuming you have Git installed on your local machine, then:

1. Locally, change to the root directory of your existing source.
2. Initialise the project by running the following commands in the terminal:

```
git init  
git add --all  
git commit -m "Initial Commit"
```

3. Log into Stash and [create a new repository](#).
4. Locate the clone URL in the nav panel on the left (for example: <https://username@your.stash.domain:7999/yourproject/repo.git>).
5. Push your files to the repository by running the following commands in the terminal (change the URL accordingly):

```
git remote add origin  
https://username@your.stash.domain:7999/yourproject/repo.git  
git push -u origin master
```

6. Done! Your repository is now available in Stash.

Import an existing Git project into Stash

You can import your existing Git repository into an empty repository in Stash. When you do this, Stash maintains your commit history.

1. Check out the repository from your existing Git host. Use the `--bare` parameter:

```
git clone --bare https://username@bitbucket.org/exampleuser/old-repository.git
```

2. Log into Stash and [create a new repository](#) (we've called it `repo.git` in this example).
3. Locate the clone URL in the nav panel on the left (for example: <https://username@your.stash.domain:7999/yourproject/repo.git>).
4. Add Stash as another remote in your local repository:

```
cd old-repository  
git remote add stash  
https://username@your.stash.domain:7999/yourproject/repo.git
```

5. Push all branches and tags to the new repository in Stash:

```
git push --all stash  
git push --tags stash
```

6. Remove your temporary local repository:

```
cd ..  
rm -rf old-repository
```

Mirror an existing Git repository

You can mirror an existing repository into a repository hosted in Stash.

1. Check out the repository from your existing Git host. Use the `--bare` parameter:

```
git clone --bare  
https://username@bitbucket.org/exampleuser/repository-to-mirror.git
```

2. Log into Stash and [create a new repository](#) (we've called it `repo.git` in this example).
3. Locate the clone URL in the nav panel on the left (for example: `https://username@your.stash.domain:7999/yourproject/repo.git`).
4. Add Stash as another remote in your local repository:

```
git remote add stash  
https://username@your.stash.domain:7999/yourproject/repo.git
```

5. Then push all branches and tags to Stash:

```
git push --all stash  
git push --tags stash
```

6. Use `git fetch origin` followed by the `git push` commands from step 3 to update the Stash mirror with new changes from the upstream repository.

Using Stash

Stash is the on-premises Git repository management solution for enterprise teams. It allows everyone in your organisation to easily collaborate on your Git repositories.

This section describes the essentials of using Stash.

If you are setting up Stash, see the [Getting started](#) section. If you want to configure Stash, see the [Administering Stash](#) section.

See [Getting started with Git and Stash](#) for an overview of how to work with Stash.

Working with projects

Stash manages related repositories as projects. Find out how to set up [projects](#) and then [give your teams access](#) to those.

Working with repositories

If you have existing projects that you want to manage in Stash, then you'll want to read [Importing code from an existing project](#).

See also:

- [Creating repositories](#)
- [Controlling access to code](#)
- [Using pull requests in Stash](#)

Git resources

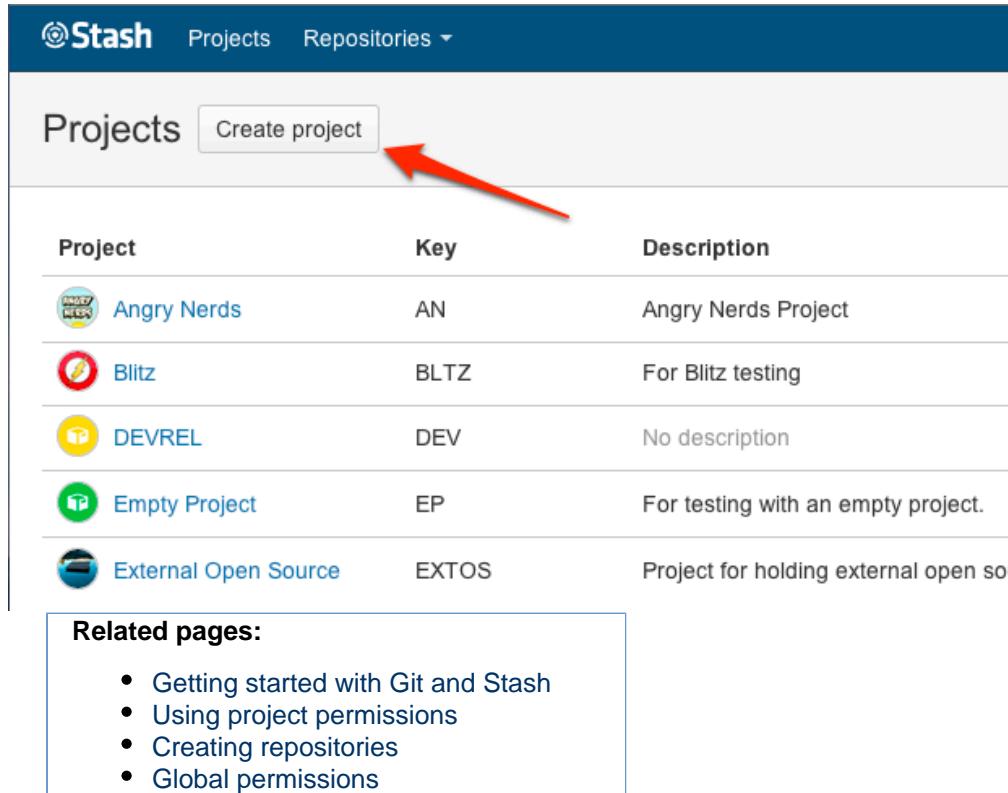

For those who are new to using Git:

- Using pull requests in Stash
- Basic Git commands
- Permanently authenticating with Git repositories

Creating projects

Projects allow you to group repositories and to manage permissions for them in an aggregated way.

To create a project, click on **Create project**:

The screenshot shows the Stash interface for managing projects. At the top, there's a navigation bar with the Stash logo, 'Projects', and 'Repositories'. Below it, a large heading says 'Projects' with a 'Create project' button next to it. A prominent red arrow points to this 'Create project' button. The main area is a table listing five existing projects:

Project	Key	Description
Angry Nerds	AN	Angry Nerds Project
Blitz	BLTZ	For Blitz testing
DEVREL	DEV	No description
Empty Project	EP	For testing with an empty project.
External Open Source	EXTOS	Project for holding external open so

Below the table, there's a section titled 'Related pages:' containing a list of links:

- Getting started with Git and Stash
- Using project permissions
- Creating repositories
- Global permissions

Fill out the form. We recommend that you use a short project key. It will be used as an identifier for your project and will appear in the URLs.

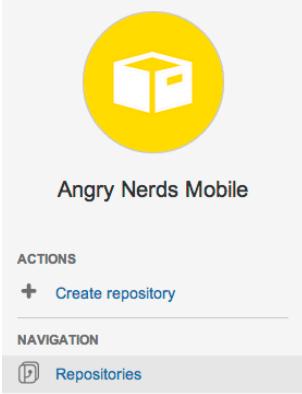

Optionally, you can choose an avatar for the project. This is displayed throughout Stash and helps to identify your project.

Click **Create project** when you're done.

Create a Project

Project name *	Angry Nerds Mobile
Project key *	ANM
Eg. AT (for a project named Atlassian)	
Description	Spiking the mobile version of Angry Nerds.
Project Avatar	 Change avatar
<input type="button" value="Create project"/> <input type="button" value="Cancel"/>	

You'll want to add repositories to the project. See [Creating repositories](#) for details.

The screenshot shows the 'Angry Nerds Mobile' project page. On the left, there's a yellow circular icon with a white cube inside. Below it, the project name 'Angry Nerds Mobile' is displayed. Under 'ACTIONS', there's a link '+ Create repository'. In the 'NAVIGATION' sidebar, 'Repositories' is selected. On the right, a message says 'There are no repositories in this project yet.' Below this, a 'Create Repository' button is shown with the description: 'Create a Git repository to manage your code. Share your repository with other users by giving them access to your project.'

Creating repositories

Repositories allow you to collaborate on code with your co-workers.

In order to create repositories you need to have [Project Admin](#) permission for the project to which you want to add a repository.

When a repository is created, the project permissions are applied to the repository. That means all repositories created in a project share the same access and permission settings.

NAVIGATION

Repositories

Once submitted you will be taken directly to your repository homepage. As there is no content in your repository yet, you'll see some instructions to help you push code to your repository:

You have an empty repository

To get started you will need to run these commands in your terminal.

Configure Git for the first time

```
git config --global user.name "Paul Watson"
git config --global user.email "pwatson@atlassian.com"
```

Working with your repository

I just want to clone this repository

If you want to simply clone this empty repository then run this command in your terminal.

```
git clone ssh://git@stash.dev.internal.atlassian.com:7999/anm/angry-nerds-android.git
```

You will find your clone URL in the lefthand sidebar of the repository homepage. You can use this URL and share it with other people.

NAVIGATION

You have an empty repository

To get started you will need to run these commands in you

Configure Git for the first time

```
git config --global user.name "Paul Watson"
git config --global user.email "pwatson@atlassian.co
```

Working with your repository

Let other people collaborate with you

In order to grant users access to this repository you have to set up permissions at the parent project level. More

information is available on [Creating projects](#).

Creating personal repositories

Stash allows you to create personal repositories, unrelated to other projects, that you can use for such purposes as storing private snippets of work, kick-starting your own project, or contributing a bug-fix for a project you are not a member of.

By default, personal repositories are not visible to other Stash users (unless they are a [Stash system administrator](#)). However, you can:

- use [repository permissions](#) to open up access to other Stash users and groups, for collaboration or review.
- allow [public access](#) (read-only) to your project, for anonymous users.

You can create personal repositories in 2 ways:

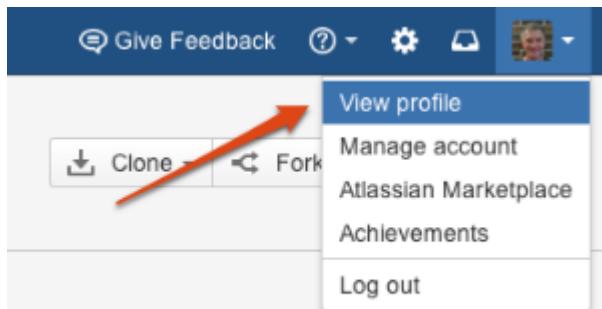

- [Directly](#), from your profile.
- By [forking](#) another repository.

Your personal repositories are listed on the **Repositories** tab of your profile page. Every Stash user can see your profile page, but they can only see those repositories that you have given them permission to view.

Directly creating a personal repository

You can create a personal repository at any time from your Stash profile:

1. Choose **View profile** from your user menu in the header.

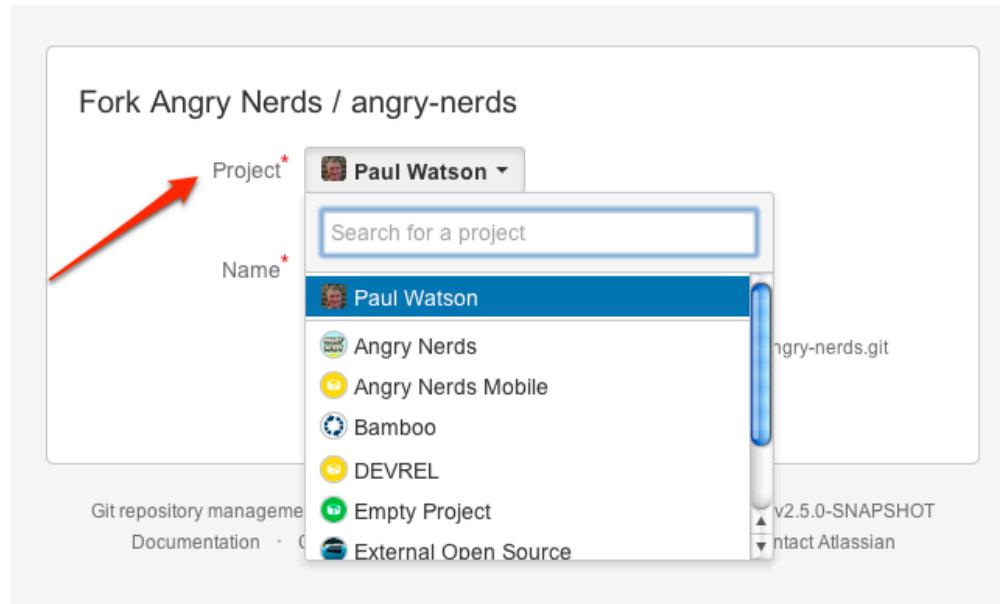

2. Click **Create repository**.
3. Set [repository permissions](#) on the new repository, if required.

Forking another repository

You can create a personal fork of any other repository in Stash for which you have [permission](#):

1. Go to the repository that you wish to fork.
2. Click **Fork** in the sidebar.
3. Choose your own profile (this is selected by default) from the **Project** list:

4. Click **Fork repository**.
5. Set [repository permissions](#) on the new repository, if required.

Using repository hooks

Hooks in Stash provide a way to customise a team's workflow and integrate with other systems. Stash currently supports two types of hooks, **pre** and **post-receive**.

On this page:

- Managing hooks
 - Pre-receive hooks
 - Post-receive hooks
- Getting hooks from the Atlassian Marketplace
- Creating your own hooks

Managing hooks

Administrators can see the hooks that are available in Stash by going to **Settings > Hooks** for a Stash repository. Once installed, hooks are available across all repositories in a Stash instance, but are enabled separately on each repository in a project.

Settings

[Repository details](#)
[Hooks](#)
[Pull requests](#)
[Branching model](#)
[Audit log](#)
[Access keys](#)

[PERMISSIONS](#)
[Repository](#)
[Branch](#)

Hooks [Add hook](#) [Learn more](#)

Hooks allow you to extend what Stash does every time the repository changes (for example, when new code is pushed or when a pull request is merged). Hooks are installed by the system administrator and can be enabled by project administrators on a per-repository basis.

Pre receive - reject commits that don't match your policies

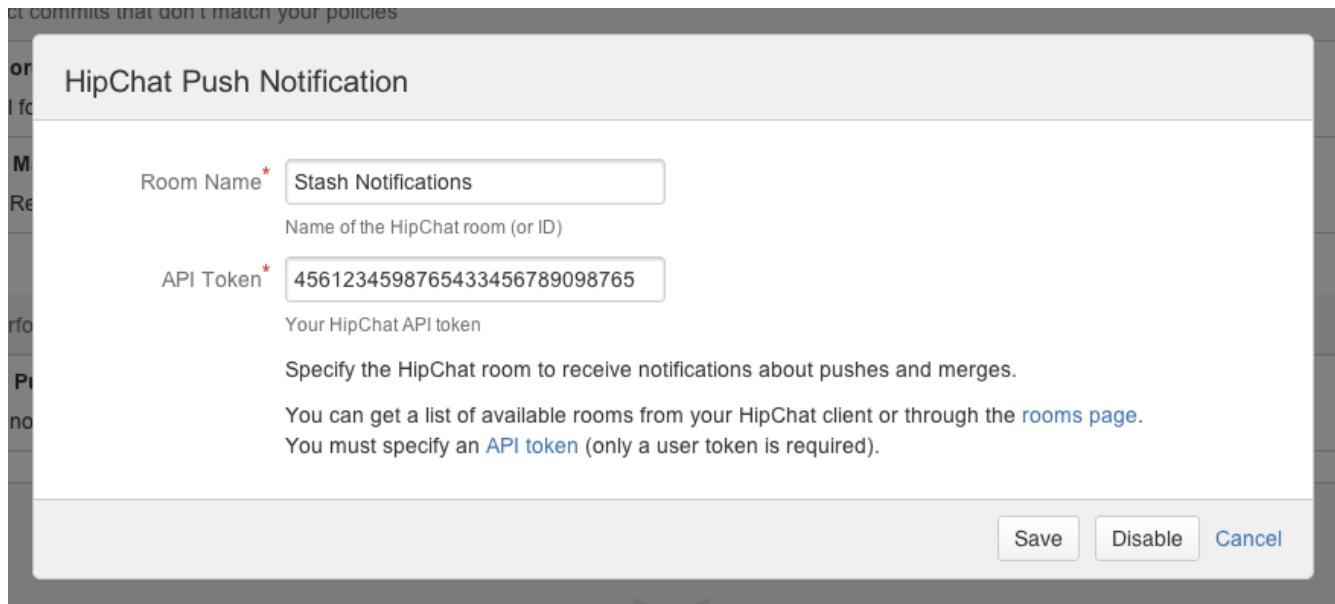

Reject Force Push
Disabled
Enabled

Post receive - perform actions after commits are processed

HipChat Push Notification
Disabled
Enabled

Created in 2014 by Atlassian. Licensed under a Creative Commons Attribution 2.5 Australia License.

Click the 'pen' icon beside the name of a hook to edit configuration details for the hook.

Stash currently ships with the following hooks:

- Reject Force Push – block all Git force pushes (`git push -- force`).
- **HipChat Push Notifications** – send a message to a HipChat room when someone pushes to the repository.

Pre-receive hooks

The first hook to run when handling a push from a client is the pre-receive hook. It can reject pushes to the repository if certain conditions are not fulfilled. You can use this hook to prevent force pushes to the repository or check whether all commits contain a valid JIRA issue key.

Post-receive hooks

The post-receive hook runs after the commits have been processed and can be used to update other services or notify users. For example [this post-receive hook](#) could be used to send a message to a chat server or notify a continuous integration server such as [Atlassian Bamboo](#) of the newly pushed changes.

Stash supports two types of post-receive hook:

- `PostReceiveHooks` map to Git's `post-receive` hooks. They run on the Stash server after a push.
- `AsyncPostReceiveRepositoryHooks`, executed by the Stash server.

Note that a Git PostReceiveHook won't be triggered after a [pull request](#) merge. The mechanism that performs the pull request merge is actually based on a `git fetch` *into* the repository, which doesn't trigger Git `post-receive` hooks. To trigger functionality based on a pull request merge, you should write an `AsyncPostReceiveRepositoryHook` for the Stash repository.

Getting hooks from the Atlassian Marketplace

A number of hooks are available from the [Atlassian Marketplace](#). You can find and install these from within Stash – simply use the **Add hook** button on the hooks settings page to view available hooks from the marketplace. See [Managing add-ons](#) for details.

Creating your own hooks

Developers can write receive hook plugins for Stash using a simple API that provides a simple way to create a configuration interface, and stores the hook's configuration settings on a per-repository basis.

For information about how to write your own hooks please see the [Stash developer docs](#).

In particular, these pages will be helpful:

- [Repository hooks](#)

- Repository hook plugin module

See too this blog post about hooks for Stash: <http://blogs.atlassian.com/2013/03/stash-git-hooks-api/>

Permanently authenticating with Git repositories

In addition to SSH, Stash supports HTTP or HTTPS for pushing and pulling from managed Git repositories. However, Git has no method of caching the user's credentials, so you need to re-enter them each time you perform a clone, push or pull.

This page describes two methods for permanently authenticating with Git repositories so that you can avoid typing your username and password each time you are pushing to or pulling from Stash.

On this page:

- Using credential caching
- Using the .netrc file

Related pages:

- Getting started with Git and Stash
- Creating repositories
- Global permissions
- Git resources

Using credential caching

You need Git 1.7.9 or above to use the HTTPS Credentials Caching feature.

Windows

On Windows you can use the application [git-credential-winstore](#).

1. Download the software.
2. Run it.
3. You will be prompted for credentials the first time you access a repository, and Windows will store your credentials for use in the future.

Linux

On Linux you can use the 'cache' authentication helper that is bundled with Git 1.7.9 and higher. From the Git documentation:

This command caches credentials in memory for use by future git programs. The stored credentials never touch the disk, and are forgotten after a configurable timeout. The cache is accessible over a Unix domain socket, restricted to the current user by filesystem permissions.

Run the command below to enable credential caching. After enabling credential caching any time you enter your password it will be cached for 1 hour (3600 seconds):

```
git config --global credential.helper 'cache --timeout 3600'
```

Run the command below for an overview of all configuration options for the 'cache' authentication helper:

```
git help credential-cache
```

OS X

Follow these steps to use Git with credential caching on OS X:

1. Download the binary [git-credential-osxkeychain](#).

2. Run the command below to ensure the binary is executable:

```
chmod a+x git-credential-osxkeychain
```

3. Put it in the directory /usr/local/bin.
4. Run the command below:

```
git config --global credential.helper osxkeychain
```

Using the .netrc file

The `.netrc` file is a mechanism that allows you to specify which credentials to use for which server. This method allows you to avoid entering a username and password every time you push to or pull from Git, but your Git password is stored in plain text.

Warning!

- Git uses a utility called `cURL` under the covers, which respects the use of the `.netrc` file. Be aware that other applications that use `cURL` to make requests to servers defined in your `.netrc` file will also now be authenticated using these credentials. Also, this method of authentication is potentially unsuitable if you are accessing your Stash server via a proxy, as all `cURL` requests that target a path on that proxy server will be authenticated using your `.netrc` credentials.
- `cURL` will not match the machine name in your `.netrc` if it has a username in it, so make sure you edit your `.git/config` file in the root of your clone of the repository and remove the user and '@' part from any clone URL's (URL fields) that look like <https://user@machine.domain.com/>... to make them look like <http://machine.domain.com/>...

Windows

1. Create a text file called `_netrc` in your home directory (e.g. `c:\users\kannonboy_netrc`). `cURL` has problems resolving your home directory if it contains spaces in its path (e.g. `c:\Documents and Settings\kannonboy`). However, you can update your `%HOME%` environment variable to point to any directory, so create your `_netrc` in a directory with no spaces in it (for example `c:\curl-auth\`) then set your `%HOME%` environment variable to point to the newly created directory.
2. Add credentials to the file for the server or servers you want to store credentials for, using the format described below:

```
machine stash1.mycompany.com
login myusername
password mypassword
machine stash2.mycompany.com
login myotherusername
password myotherpassword
```

Linux or OS X

1. Create a file called `.netrc` in your home directory (`~/.netrc`). Unfortunately, the syntax requires you to store your passwords in plain text - so make sure you modify the file permissions to make it readable only to you.
2. Add credentials to the file for the server or servers you want to store credentials for, using the format described in the 'Windows' section above. You may use either IP addresses or hostnames, and you do *not* need to specify a port number, even if you're running Stash on a non-standard port.
3. And that's it! Subsequent `git clone`, `git pull` and `git push` requests will now be authenticated using the credentials specified in this file.

Controlling access to code

Stash provides the following types of permissions to allow fully customisable control of access to code.

Note that you can also:

- allow public (anonymous) access to projects and repositories. See [Allowing public access to code](#).
- use SSH keys to allow user accounts and other systems to connect securely to Stash repositories for Git operations. See [Using SSH keys to secure Git operations](#).

Global permissions

- Control user and group access to Stash projects and to the Stash server configuration.
- For example, these can be used to control the number of user accounts that can access Stash for licensing purposes.
- See [Global permissions](#).

Project permissions

- Apply the same access permissions to all repositories in a project.
- For example, these can be used to define the core development team for a project.
- See [Using project permissions](#).

Repository permissions

- Extend access to a particular repository for other, non-core, users.
- For example, these can be used to allow external developers or consultants access to a repository for special tasks or responsibilities.
- See [Using repository permissions](#).

Branch permissions

- Control commits to specific branches within a repository.
- For example, these can provide a way to enforce workflow roles such as the Release Manager, who needs to control merges to the release branch.
- See [Using branch permissions](#).

Permissions matrix

The table below summarizes the cumulative effect of the permissions described above for anonymous and logged in users. In general, repository permissions override project permissions. A [personal project](#) can not be made public.

Key

Permission	Effect
BROWSE	Can view repository files, clone, pull to local
READ	Can browse, clone, pull, create pull requests, fork to a personal project
WRITE	Can merge pull requests
ADMIN	Can edit settings and permissions

Global (logged in)	Project	Repository	Branch	Effective permission
✗	Personal	Personal	NA	No access
✗	Personal	Public access	NA	BROWSE just that repo
✗	No access	No access	NA	No access

X	No access	Public access	NA	BROWSE just that repo
X	Public access	Public access	NA	BROWSE all repos in project
✓	Personal	Personal	NA	No access
✓	Personal	Public access	NA	READ just that repo
✓	No access	No access	NA	No access
✓	No access	Public access	NA	READ just that repo
✓	Public access	No access	NA	READ all repos in project
✓	Public access	Public access	NA	READ
✓	Public access	Public access	For this user	READ that branch, no WRITE
✓	No access	READ	NA	READ just that repo
✓	Public access	READ	NA	READ just that repo
✓	READ	No access	NA	READ all repos in project
✓	READ	Public access	NA	READ all repos in project
✓	READ	READ	NA	READ all repos in project
✓	READ	No access	For this user	READ that branch, no WRITE
✓	No access	WRITE	NA	WRITE just that repo
✓	Public access	WRITE	NA	WRITE just that repo
✓	WRITE	No access	NA	WRITE all repos in project
✓	WRITE	WRITE	NA	WRITE all repos in project
✓	WRITE	WRITE	For other users	WRITE to other branches only
✓	ADMIN			Can edit settings and permissions

Using branch permissions

Branch permissions allow you to control who can commit to specific branches in a repository. Branch permissions provide another level of security within Stash (along with [user authentication](#) and [project](#), [repository](#) and [global permissions](#)) that provides a way to control, or enforce, your own workflow or process.

Branch permissions:

- are based on users or groups.
- are actually restrictions, which are checked after project and repository level permissions.
- are used to limit branch access to specific people. who must still have write access to the project or repository.

- prevent unauthorised users pushing to or deleting the branch.
- are based on explicit branch names, or you can use advanced branch permissions to match multiple branches (or tags) using [pattern matching](#).

For example, if two developers Xavier and Yves have write access to repository R, but only Xavier has branch permissions on branch B, then Yves won't be able to push to B.

If a user does not have commit access to the branch, an error message will be shown on the Git command line when they try to push a change to the branch.

Note that if no branch permissions are defined then anyone with commit access to the repository can push to any branch.

On this page:

- [Setting branch permissions](#)
- [Advanced branch permissions](#)

Related pages:

- [Using pull requests in Stash](#)
- [Controlling access to code](#)
- [Global permissions](#)

Setting branch permissions

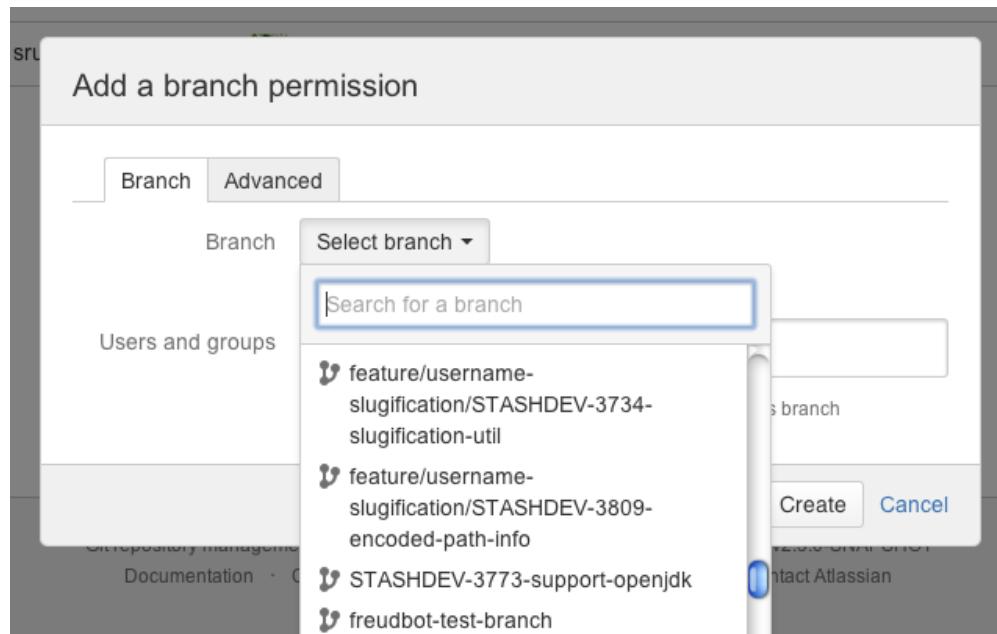

Branch permissions in Stash are set on a per-repository basis. Makes sense – branch permissions control access to *repository* branches, right?

You'll need either project admin, admin or sys-admin [permissions](#) to set branch permissions.

So, to set branch permissions:

1. Go to a repository in a project.
2. Choose **Settings > Branch** (under 'Permissions').
3. Click **Add permission**.
4. On the **Branch** tab, choose the branch for which you want to control access.
5. Add (or remove) users or groups that you want to have (or not have) commit access to the branch.
6. Click **Create** to finish.

You can always change the permissions for a branch later, if necessary.

Advanced branch permissions

Advanced branch permissions specify a pattern that is matched against branches *and tags* being pushed to Stash; this allows you to restrict any pushes to branches that match the pattern.

Advanced branch permission also apply to attempts to create new branches; if a push to Stash attempts to create a new branch that matches a pattern, the user must be authorised for the operation to proceed.

To set advanced branch permissions, choose **Settings > Branch**, and click **Add permission**, as described above.

On the **Advanced** tab, enter a **glob pattern** to match the names of multiple branches for which you want to control access.

Branch permission patterns

Stash supports a powerful type of pattern syntax for matching branch names (similar to pattern matching in Apache Ant).

These expressions use the following wild cards:

?	Matches one character (any character except path separators)
*	Matches zero or more characters (not including path separators)
**	Matches zero or more <i>path segments</i> .

Pattern used in branch permissions match against all refs pushed to Stash (i.e. branches and tags).

In git, branch and tag names can be nested in a namespace by using directory syntax within your branch names, e.g. `stable/1.1`. The `**` wild card selector enables you to match arbitrary directories.

- A pattern can contain any number of wild cards.
- If the pattern ends with `/` then `**` is automatically appended - e.g. `foo/` will match any branches or tags containing a `foo` path segment
- Patterns only need to match a suffix of the fully qualified branch or tag name. Fully qualified branch names look like `refs/heads/master`, whilst fully qualified tags look like `refs/tags/1.1`.

Also see the [Ant documentation](#).

Examples

*	Matches everything
PROJECT-*	Matches and branch or tag named PROJECT-*, even in a name space. e.g. <code>refs/heads/PROJECT-1234</code> , <code>refs/heads/stable/PROJECT-new</code> or <code>refs/tags/PROJECT-1.1</code>

?.?	Matches any branch or tag of 2 characters separated by a '.'. e.g. refs/heads/1.1, refs/heads/stable/2.X or refs/tags/3.1
tags/ or tags/**	Matches all tags and any branches with 'tags' as a namespace. e.g. refs/heads/stable/tags/some_branch, refs/tags/project-1.1.0
heads/**/master	Matches all branches called master. e.g. refs/heads/master, refs/heads/stable/master

Using repository permissions

Stash allows you to manage the permissions for just a single repository, or for a group of repositories together from the project.

Repository permissions allow you to extend access to a repository, for those who don't have project permissions. For example, you might use repository permissions to allow external developers or consultants access to a repository for special tasks or responsibilities.

Stash supports 3 levels of permissions for repositories:

- Admin
- Write
- Read

Depending on the permission level for the repository that has been granted to you, you can perform different actions in the repository:

Related pages:

- [Using project permissions](#)
- [Using branch permissions](#)
- [Global permissions](#)
- [Allowing public access to code](#)

	Browse	Clone, fork, pull	Create, browse or comment on a pull request	Merge a pull request	Push	Edit settings and permissions
Admin	✓	✓	✓	✓	✓	✓
Write	✓	✓	✓	✓	✓	✗
Read	✓	✓	✓	✗	✗	✗

Note that:

- Anyone with permission to browse a pull request can create a task on any comment, and can browse, resolve and reopen existing tasks in the pull request.
- Repository admins and pull request authors can edit and delete *any* task in the pull request. Reviewers and others can only edit or delete their own tasks.

Granting access to a repository

To modify its permissions, go to the repository's settings and click on **Repository** (under 'Permissions'). Click in the **Add Users** or **Add Groups** field in the relevant section to search for, and bulk add, users or groups. Now choose a permission from the list and click **Add**.

Once added, you can use the checkboxes to edit specific permissions for an individual user or a particular group.

Granting access to all repositories within a project

If you have a large number of repositories in a project, [project level permissions](#) provide a convenient way to grant access to *all* repositories within that project. For example you can grant a group, say "Team A", *Write* access at the project level, which will automatically give them *Write* access to all existing repositories in the project, as well as any repositories that are subsequently created in the project.

To modify permissions for a project, click the **Permissions** tab when viewing the project. You can add, or modify, permissions for individual users, and groups, in the same way as described above for a single repository.

Granting permission to create repositories

Only users with [project administration](#) permission can create *new repositories*.

Using project permissions

Stash allows you to manage the permissions for the repositories in a project in an aggregated way.

There are 3 levels of project permission that you can assign to a user or group for a project: *Admin*, *Write* and *Read*.

Related pages:

- [Creating projects](#)
- [Global permissions](#)
- [Using branch permissions](#)
- [Using repository permissions](#)
- [Allowing public access to code](#)

	Browse	Clone / Pull	Create, browse, comment on pull request	Merge pull request	Push	Create repositories	Edit settings / permissions
Project Admin	✓	✓	✓	✓	✓	✓	✓
Write	✓	✓	✓	✓	✓	✗	✗
Read	✓	✓	✓	✗	✗	✗	✗

To modify permissions for a project, go to **Settings > Permissions** for the project. Click in the **Add Users** or **Add Groups** fields in the relevant section to search for, and bulk add, users or groups. Now choose a permission from the drop-down list, and click **Add**.

Once added, you can use the checkboxes to edit specific permissions for particular users or groups.

Repository permissions

Repository permissions allow you to extend access to users and groups beyond that already granted via project permissions.

Public Access

Allow users without a Stash account to clone and browse this repository.

Enable

User access

Name	Admin	Write	Read
Add Users			<input type="button" value="Read ▾"/> <input type="button" value="Add"/>
Xu-Heng Tjhin	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Group access

Name	Admin	Write	Read
Add Groups			<input type="button" value="Read ▾"/> <input type="button" value="Add"/>
bamboo-agent	ADDED	<input type="checkbox"/>	<input type="checkbox"/> <input checked="" type="checkbox"/>

Allowing public access to code

You can open up public access for anonymous (unauthenticated) users to projects and repositories in Stash. This allows you to:

- Broadcast your repositories to a wider audience who generally don't have access to your source.
- Utilise unauthenticated cloning of repositories when setting up continuous integration servers to work with Stash.
- Link from other systems, for example JIRA or Confluence, to give users access to code without requiring authentication.
- Create open-source projects or repositories.

Public access allows anonymous users to browse the files, pull requests and commits for a specific repository or an entire project, and to clone repositories, without needing to log in, or have an account in Stash.

In Stash, you can:

- Configure a specific repository for public access.
- Configure a project to allow public access to all repositories in the project.
- Disable anonymous access by setting a global system property.

On this page:

- Making a repository publicly accessible
- Making a project publicly accessible
- Viewing public repositories
- Disabling public access globally

Related pages:

- Using project permissions
- Using repository permissions

Making a repository publicly accessible

You can open up a specific repository for public (anonymous) access.

You need admin permission for the repository.

Go to the repository and click **Settings**, then **Repository** (under 'Permissions'). Check **Enable** (under 'Public Access') to allow users without a Stash account to clone and browse the repository.

Making a project publicly accessible

You can open up a whole project (but not a private project) for public (anonymous) access.

You need admin permission for the project.

Go to the project and choose **Settings**, then **Permissions**. Check **Enable** (under 'Public Access') to allow users without a Stash account to clone and browse any repository in the project.

Viewing public repositories

Stash displays a list of repositories for which anonymous access has been enabled.

Anonymous and logged-in users can choose **Repositories > View all public repositories** to see these.

Disabling public access globally

Stash provides a [system property](#) that allows you to turn off public access for the whole instance.

To do this, set the `feature.public.access` property to false in the `stash.config.properties` file in your [Stash home directory](#).

Using SSH keys to secure Git operations

Stash provides a simple way for user accounts and other systems to connect securely to Stash repositories, using SSH keys, in order to perform Git operations. You can:

- add a personal key to a Stash user account to allow a developer to easily authenticate when performing read operations from his or her local machine. A Stash user can add any number of keys to their account. Read more at [SSH user keys for personal use](#).
- add an access key to a Stash project or repository to allow other systems, such as build servers like Atlassian's [Bamboo](#), to authenticate for either read-only (pull, clone) or read-write (push, merge) operations, without the need to store user credentials. Read more at [SSH access keys for system use](#).

Related pages:

- [Creating SSH keys](#)
- [Enabling SSH access to Git repositories in Stash](#)
- [Permanently authenticating with Git repositories](#)

Before you can use SSH keys to secure a connection with Stash the following must have already been done:

- your Stash administrator must have already [enabled SSH access](#) in Stash.
- you need an SSH key! See [Creating SSH keys](#). Alternatively, you can use an existing key, if it isn't already being used as a repository or project access key in Stash.

Note that:

- You can use the same SSH system access key for multiple repositories or projects.
- A Stash user can add any number of keys to their account.
- Keys used for personal user accounts can't be re-used as a project or repository access key, and keys used as a project or repository access key can't be re-used for user accounts.
- Stash supports DSA and RSA2 key types – RSA1 is not supported.

Creating SSH keys

This page describes how to create SSH keys.

SSH keys can be used to establish a secure connection with Stash for:

- when you are performing Git operations from your local machine
- when another system or process needs access to repositories in Stash (for example your build server)

The SSH key needs to be added to Stash, and your Stash administrator must have enabled SSH access to Git repositories, before you can make use of the key.

Supported key types are DSA and RSA2 – RSA1 is not supported.

On this page:

Related pages:

- [Using SSH keys to secure Git operations](#)
- [Enabling SSH access to Git repositories in Stash](#)
- [Permanently authenticating with Git repositories](#)

Creating an SSH key on Windows

1. Check for existing SSH keys

You should check for existing SSH keys on your local computer. You can use an existing SSH key with Stash if you want, in which case you can go straight to [Using SSH keys to secure Git operations](#).

Open a command prompt, and run:

```
cd %userprofile%/.ssh
```

- If you see "No such file or directory", then there aren't any existing keys: [go to step 3](#).
- Check to see if you have a key already:

```
dir id_*
```

If there are existing keys, you may want to use them: go to [Using SSH keys to secure Git operations](#).

2. Back up old SSH keys

If you have existing SSH keys, but you don't want to use them when connecting to Stash, you should back those up.

In a command prompt on your local computer, run:

```
mkdir key_backup  
copy id_rsa* key_backup
```

3. Generate a new SSH key

If you don't have an existing SSH key that you wish to use, generate one as follows:

1. Log in to your local computer as an administrator.
2. In a command prompt, run:

```
ssh-keygen -t rsa -C "your_email@example.com"
```

Associating the key with your email address helps you to identify the key later on.

Note that the `ssh-keygen` command is only available if you have already [installed Git \(with Git Bash\)](#). You'll see a response similar to this:

```
C:\Users\ASUS>ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (</c/Users/ASUS/.ssh/id_rsa>):
```

3. Just press <Enter> to accept the default location and file name. If the .ssh directory doesn't exist, the system creates one for you.
4. Enter, and re-enter, a passphrase when prompted. The whole interaction will look similar to this:

```
C:\Users\ASUS>ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (</c/Users/ASUS/.ssh/id_rsa>):
Created directory '/c/Users/ASUS/.ssh'.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /c/Users/ASUS/.ssh/id_rsa.
Your public key has been saved in /c/Users/ASUS/.ssh/id_rsa.pub.
The key fingerprint is:
e6:99:c3:3c:52:fb:9c:e4:3f:df:4d:b2:80:11:a5:1e ASUS@ASUS-PC
C:\Users\ASUS>
```

5. You're done! Now [add the new key to Stash](#).

Creating an SSH key on Linux & Mac OS X

1. Check for existing SSH keys

You should check for existing SSH keys on your local computer. *You can use an existing SSH key with Stash if you want, in which case you can go straight to [Using SSH keys to secure Git operations](#).*

Open a terminal and run the following:

```
cd ~/.ssh
```

- If you see "No such file or directory", then there aren't any existing keys: [go to step 3](#).
- Check to see if you have a key already:

```
ls id_*
```

- If there are existing keys, you may want to use them; go to [Using SSH keys to secure Git operations](#).

2. Back up old SSH keys

If you have existing SSH keys, but you don't want to use them when connecting to Stash, you should back those up.

Do this in a terminal on your local computer, by running:

```
mkdir key_backup
cp id_rsa* key_backup
```

3. Generate a new key

If you don't have an existing SSH key that you wish to use, generate one as follows:

1. Open a terminal on your local computer and enter the following:

```
ssh-keygen -t rsa -C "your_email@example.com"
```

Associating the key with your email address helps you to identify the key later on.

You'll see a response similar to this:

```
pwatson-Mac-Pro: ~ pwatson$ ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (/Users/pwatson/.ssh/id_rsa):
```

2. Just press <Enter> to accept the default location and file name. If the `.ssh` directory doesn't exist, the system creates one for you.
3. Enter, and re-enter, a passphrase when prompted.

The whole interaction will look similar to this:

```
pwatson-Mac-Pro: ~ pwatson$ ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (/Users/pwatson/.ssh/id_rsa):
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /Users/pwatson/.ssh/id_rsa.
Your public key has been saved in /Users/pwatson/.ssh/id_rsa.pub.
The key fingerprint is:
47:68:04:f3:93:53:a3:af:bd:fc:86:60:30:47:cd:ea pwatson@pwatson-Mac-Pro.local
The key's randomart image is:
+--[ RSA 2048]----+
|       oo      |
|     +.=o.    |
|     .O..     |
|     o.o=    |
|     =S o     |
|       E+     |
|       ....   |
|       ....   |
|       oo.    |
+-----+
pwatson-Mac-Pro: ~ pwatson$
```

4. You're done! Now [add the new key to Stash](#).

SSH user keys for personal use

You can use SSH keys to establish a secure connection between your computer and Stash for when you are performing read-only (pull, clone) Git operations from your local machine. Personal keys are attached to your Stash account – they are bound by that account's permissions and use the account's identity for any operations.

Before you can use SSH keys to secure a connection with Stash the following must have already been done:

- your Stash administrator must have already [enabled SSH access](#) in Stash.
- you need an SSH key! See [Creating SSH keys](#). Alternatively, you can use an existing key, if it isn't already being used as a repository or project access key.
- you need to have added your personal SSH key to your Stash account – see the following section.

Once you have an SSH key associated with your Stash account, using it is easy! See [Use SSH keys to connect to Stash repositories](#) below.

Note that:

- Stash supports DSA and RSA2 key types – RSA1 is not supported.
- A Stash user can add any number of keys to their account.
- You can use the same SSH access key for multiple repositories or projects.
- Keys used for personal user accounts can't be re-used as a [project or repository access key](#), and keys used as a project or repository access key can't be re-used for user accounts.

Related pages:

- [Creating SSH keys](#)
- [Enabling SSH access to Git repositories in Stash](#)
- [Permanently authenticating with Git repositories](#)

Add an SSH key to your Stash account

1. On Windows, in your command prompt, change directory to your .ssh directory, and copy the public key file to your clipboard by running:

Windows

```
cd %userprofile%/.ssh  
clip < id_rsa.pub
```

On Mac OS X or Linux simply run the following in a terminal:

Mac OS X

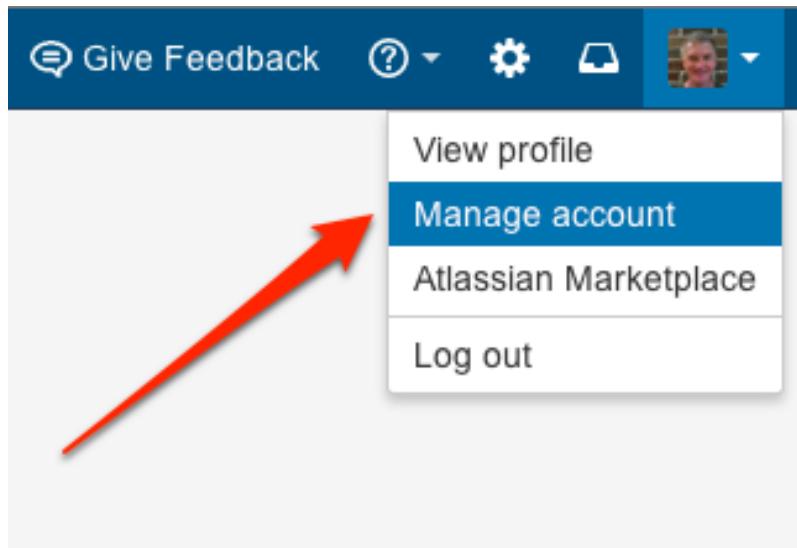

```
pbcopy < ~/.ssh/id_rsa.pub
```

Note that on Linux, you may need to download and install xclip, then use that, as shown in this code snippet:

Linux

```
sudo apt-get install xclip  
xclip -sel clip < ~/.ssh/id_rsa.pub
```

2. In Stash, go to your account:

3. Click on **SSH keys** and then **Add key**.
4. Paste the key into the text box:

Add public key

Key*

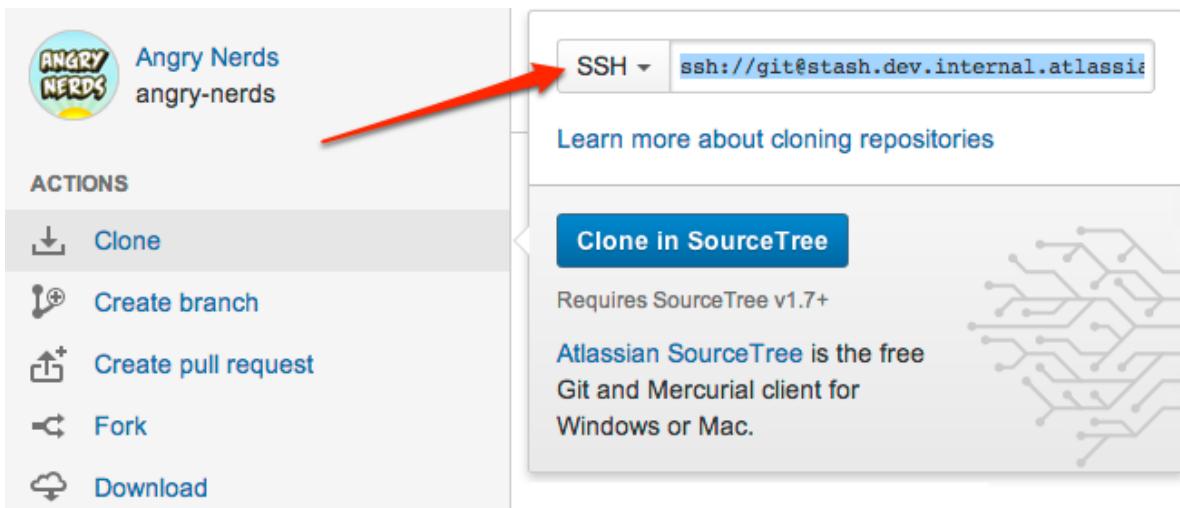

```
ssh-rsa
AAAAB3NzaC1yc2EAAAABlwAAA
6ea78e5nb8IKGo5FZ0H+3ZMlw>
UiiW53Som5j8XOnhLdjrNP6EIJglA
eXsvCzoKJRmL7Q4o8EH2Hgs7M
y00kRVbnm2HzlxtqhvWSUHxbA63
Ywkj7POzSRzoodq0NP8FqTb2aU
N7ZlhgbIn
/AV/j79zVEcpIX1bn5DmyUU87GuI
yJzJRlyu7txrH9VSOntQ== pwats
```

5. Click **Add key**. You're done!

Use SSH keys to connect to Stash repositories

SSH access needs to have been set up, as described above. Once this is done, you can use SSH keys as follows:

1. Go to **Projects**, click a project, and choose a repository from the list.
2. Click **Clone** in the sidebar to see the clone URLs for the repository.
3. Choose the clone URL you want to use. SSH is available if you have already added an SSH key to your account. If you haven't done that yet, see [Add an SSH key to your Stash account](#), above.

SSH access keys for system use

Stash administrators can set up SSH access keys to secure the Git operations that other systems perform on the repositories managed in Stash. Using access keys avoids the need to store user credentials on another system, and means that the other system doesn't have to use a specific user account in Stash. For example, access keys can be used to allow your build and deploy server to authenticate with Stash to check out and test source code.

- Project admins can add and manage SSH access keys for a project. The keys apply to every repository in the project.
- Repository admins can add and manage SSH access keys for a particular repository.
- The access key can allow either *read-only* or *read-write* Git operations.

Related pages:

- [Creating SSH keys](#)
- [Enabling SSH access to Git repositories in Stash](#)
- [Permanently authenticating with Git repositories](#)

Settings

The screenshot shows the 'Access keys' section of the Stash Settings page. On the left, there's a sidebar with links: Project details, Audit log, Permissions, and Access keys (which is highlighted). The main area has a heading 'Access keys' with a 'Add key' button. Below it is a note: 'Access keys provide a simple way for other systems to access repositories using SSH without storing user credentials.' A table lists two access keys:

Label	Key
mobileapp@team-game.com	ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAQEA04Mhb5KFkuHbZYvZFNvpI0yum8O1D...
twitterapp@ridinghigh.com	ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAQEA6CYOy4zGRuXf3wHsgITnoVJLWYFxq...

Note that Stash supports DSA and RSA2 key types – RSA1 is not supported.

Before you can use SSH keys to secure a connection with Stash the following must have already been done:

- Your Stash administrator must have already [enabled SSH access](#), on Stash.
- You must have already created an SSL key. See [Creating SSH keys](#). Alternatively, you can use an existing key, if it isn't already being used for a personal account in Stash.

Using SSH keys to allow access to Stash repositories

To get the SSH key to work with your build, or other, system, you need to:

- Add the private key to that system. For Bamboo, see this page: [Sharing repository credentials](#).
- Add the public key to Stash as described here:

Add an SSH access key to either a Stash project or repository

You simply copy the public key, from the system for which you want to allow access, and paste it into Stash.

1. Copy the public key. One approach is to display the key on-screen using `cat`, and copy it from there:

```
cat < ~/.ssh/id_rsa.pub
```

2. Now, in Stash, go to the **Settings** tab for the project or repository.
3. Click **Access keys** and then **Add key**.
4. Choose the **Read** permission, for `git pull` or `git clone` operations for example, where you want to be sure that the system will *not* be able to write back to the Stash repository.
Choose the **Read / Write** permission, for `git push` or `git merge` operations for example, where you may want your build system to merge successful feature branch builds to the default branch in the

Stash repository, or so that deployments can be tagged.

Note that if you attempt to add a key already present on a project or repository but with a different permission to what it currently has, the permission will simply be updated.

- Paste the key into the text box and click **Add key**.

Add public key

Permission Read Read / Write

Key

Stash license implications

- System access keys do not require an additional Stash user license.

Reusing access keys

- You can use the same SSH access key for multiple repositories or projects.
- Keys used for [personal user accounts](#) can't be re-used as a project or repository system access key, and keys used as a project or repository access key can't be re-used for user accounts.

Deleting an access key

You can delete an access key by going to **Settings > Access keys** for the repository, and clicking the cross for the key (the cross only appears when you move the mouse pointer there):

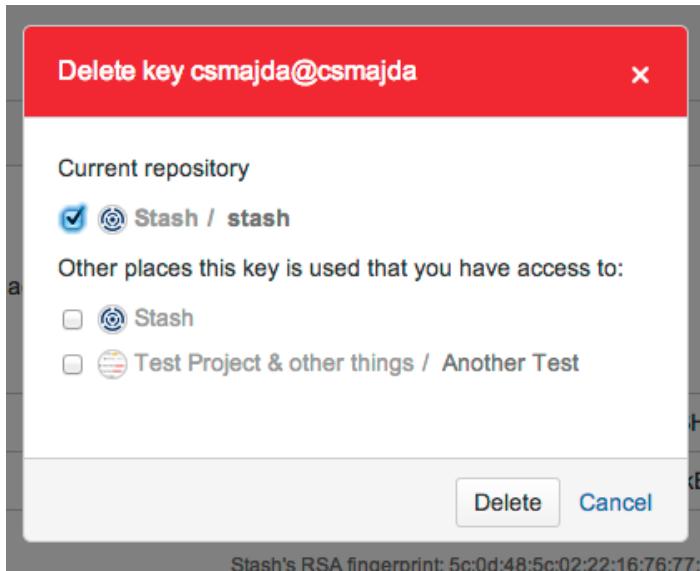

Access keys

[Add key](#)

Access keys provide a simple way for other systems to access repositories using SSH without storing user credentials.

Label	Key	Permission
csmajda@csm...	ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQCBP... ...xHgfqx0...	Read 
cszmajda@sta...	ssh-rsa AAAAB3NzaC1yc2EAAAQABAAQDYgIIH2fkBQtW... ...tW...	Read

If the key is used for multiple projects or repositories, you can select the other places that you want the key to be deleted from:

Note that the dialog only displays the projects and repositories that you have permission to see. Be aware that the key may also be used in other places that are not listed in the dialog. To be 100% sure that *all* uses of the key are deleted, this operation must be performed by someone with the administrator or sysadmin **global** permission.

Workflow strategies in Stash

Various Git workflows are supported by Stash:

- [Centralized Workflow](#)
- [Feature Branch Workflow](#)
- [Gitflow Workflow](#)
- [Forking Workflow](#)

For information about setting up Git workflows in Stash see [Using branches in Stash](#) and [Using forks in Stash](#).

Centralized Workflow

Like Subversion, the Centralized Workflow uses a central repository to serve as the single point-of-entry for all changes to the project. Instead of `trunk`, the default development branch is called `master` and all changes are committed into this branch. This workflow doesn't require any other branches besides `master`.

[Read more about the Centralized Workflow...](#)

Workflow uses a central repository to serve as the single point-of-entry for all changes to the project. Instead of `trunk`, the default development branch is called `master` and all changes are committed into this branch. This workflow doesn't require any other branches besides `master`.

[Read more about the Centralized Workflow...](#)

Feature Branch Workflow

The core idea behind the Feature Branch Workflow is that all feature development should take place in a dedicated branch instead of the `master` branch. This encapsulation makes it easy for multiple developers to work on a particular feature without disturbing the main codebase. It also means the `master` branch will never contain broken code, which is a huge advantage for continuous integration environments.

[Read more about the Feature Branch Workflow...](#)

Gitflow Workflow

The Gitflow Workflow defines a strict branching model designed around the project release. While somewhat more complicated than the Feature Branch Workflow, this provides a robust framework for managing larger projects.

[Read more about the Gitflow Workflow...](#)

Forking Workflow

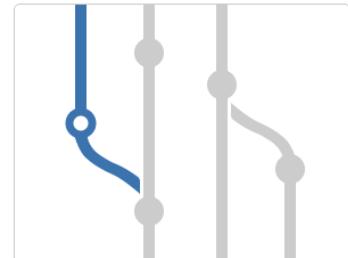

The Forking Workflow is fundamentally different than the other workflows discussed in this tutorial. Instead of using a single server-side repository to act as the “central” codebase, it gives every developer a server-side repository. This means that each contributor has not one, but two Git repositories: a private local one and a public server-side one.

[Read more about the Forking Workflow...](#)

Using branches in Stash

Stash makes it easy for each member of your team to use a [branching workflow](#) for your Git development process. Your workflow can be mapped to branches in the Stash ‘branching model’, allowing Stash to:

- guide your developers into making consistent naming decisions when creating branches.
- identify the type of each branch and apply actions like automatic merging accordingly.

On this page:

- [Configuring the branching model](#)
- [Creating branches](#)
- [Automating the branch workflow](#)
- [Managing all your branches](#)
- [Read more](#)

See also [Using branch permissions](#) for information about restricting access to branches in Stash.

Configuring the branching model

Stash uses a ‘branching model’ to define the branch workflow for each repository. As a project administrator, configuring the model lets you:

- enable the branch types that will be available in your workflow.
- specify the naming convention to be used for each branch type.

The naming convention simply adds prefixes to branch names, so that branches of the same type get the same prefix.

To configure the branching model for a repository, go to **Settings > Branching model** for the repository and click **Enable branching model**. Note that for *new* repositories, the branching model is enabled by default, and uses the default branch prefixes.

Stash makes a number of branch types available, as described below. Use the checkboxes to enable just those branch types that map to your workflow. Note that several branch types have default branch naming prefixes (for example the default prefix for the ‘feature’ branch type is `feature/`), as shown:

Development	Feature	feature/
</>	This is generally the integration branch for feature work and is often the default branch (e.g. <code>master</code>) or a named branch such as <code>develop</code> . In a workflow using pull requests, this is usually the branch where new feature branches are targeted. In other cases, developers might commit directly to this branch.	
★	Feature branches are used for specific feature work or improvements. They generally branch from, and merge back into, the development branch, by means of pull requests. See Feature branch workflow .	

**Production**

The production branch is used while deploying a release. It branches from, and merges back into, the development branch. In a Gitflow-based workflow it is used to prepare for a new production release.

**Release**`release/`

Release branches are used for release task and long-term maintenance of software versions. Typically, they branch from, and fixes are merged back into, the development branch. Merging into an older release branch allows for [automated merging](#) to newer release branches as well as the development branch.

**Bugfix**`bugfix/`

Bugfix branches are typically used to fix release branches.

**Hotfix**`hotfix/`

Hotfix branches are used to quickly fix the production branch without interrupting changes in the development branch. In a Gitflow-based workflow, changes are usually merged into the production and development branches.

Note that:

- Prefixes can't be empty.
- Prefixes can't be longer than 30 characters.
- Prefixes can't overlap; for example PROD and PRODUCT would be overlapping prefixes.
- For Stash instances using Microsoft SQL Server, prefixes can't use non-ASCII characters. See [STASH-3884 - Non-ASCII values used as branch model prefixes/branch names don't work in MSSQL](#) [OPEN](#).

Creating branches

You can create a new branch from [in JIRA](#) (version 6.1 and above) or [in Stash](#). Either way, you can override the settings that Stash suggests for the repository, branch type, branching point and branch name.

From a JIRA issue

JIRA must be connected with Stash by an [application link](#) for this functionality to be available.

When viewing an issue in JIRA or JIRA Agile, click **Create Branch** (under 'Development' – you'll need the 'View Development Tools' project permission in JIRA to see this):

Dates

Created:	14/Nov/12 1:55 PM
Updated:	15/Aug/13 2:01 PM

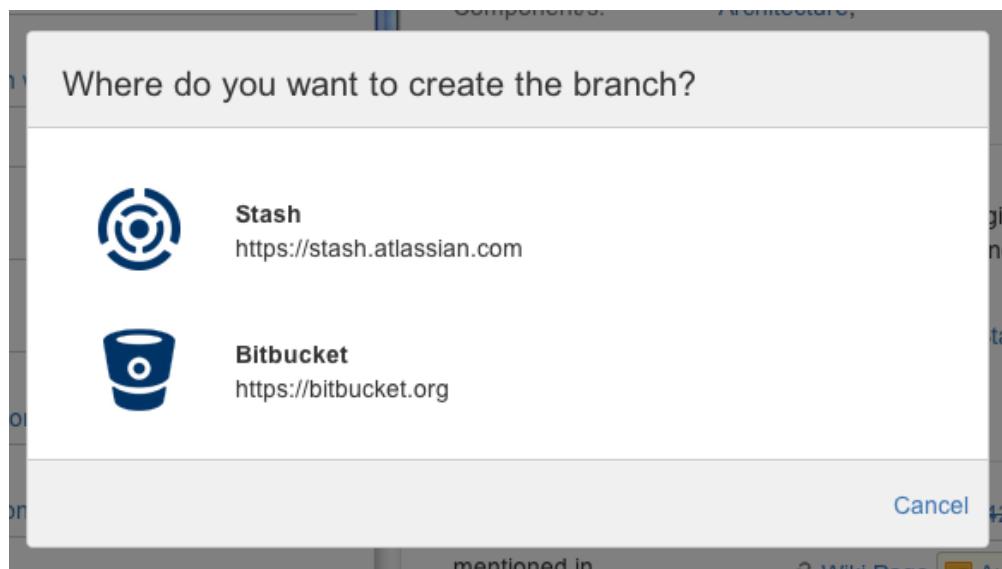

Development

[Create Branch](#)

Agile

[View on Board](#)

Choose the SCM, if more than one is available, where you want to create the branch:

Stash suggests the **Branch type** and **Branch name** based on the JIRA issue type and summary. Change the [settings](#) suggested by Stash, if necessary:

Create branch for STASHDEV-2493

Repository: Paul Watson / stash

Branch type: Feature

Branch from: master

Branch name: feature/ STASHDEV-2493-enhance-the-data-r

Commit graph:

```

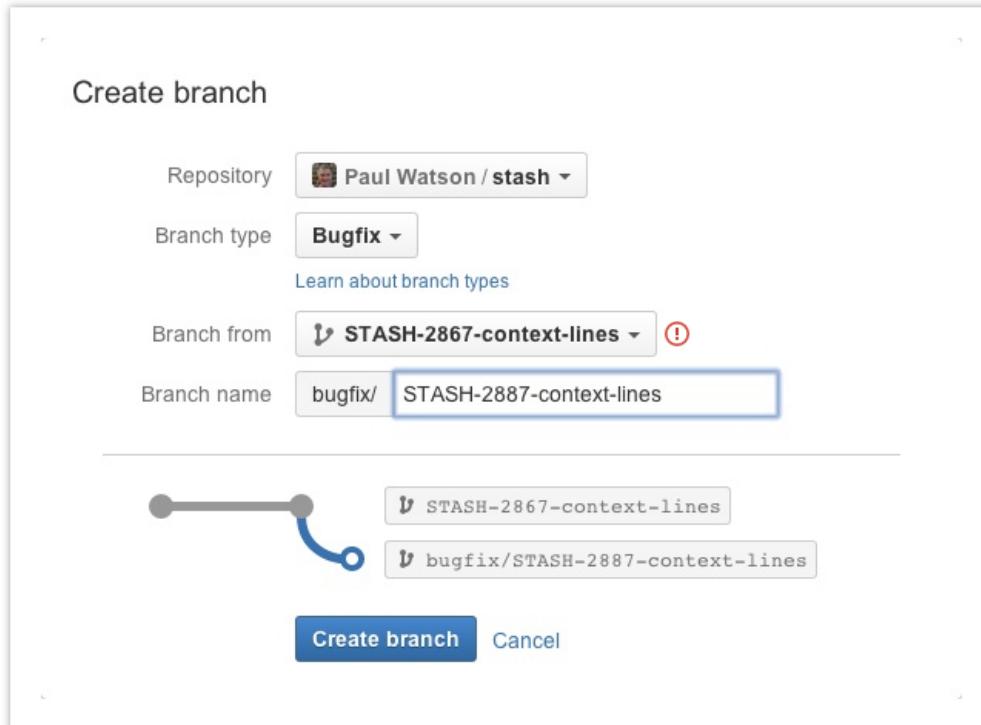

graph LR
    master[master] --- feature[feature/ STASHDEV-2493-enhance-the-data-r]
  
```

Create branch Cancel

From in Stash

In Stash, choose **Create branch** from the sidebar.

Stash will suggest the **Branch type** and **Branch name** based on the JIRA issue type and summary. Notice that Stash displays the current [build status](#) beside the source branch picker. Change the [settings](#) suggested by Stash if necessary:

Creating the branch

You can specify:

- the **Repository**
- the **Branch type**, if a [branching model](#) has been previously configured – choose **Custom** if you need an *ad hoc* branch type
- the branch point
- the **Branch name** – the prefix is based on the branch type you selected, and as defined by the [branching model](#). Note that the branch name should follow your team's convention for this.

Note that Stash suggests a **Branch type** based on the JIRA issue type, when a [branching model](#) is configured. The mapping is:

JIRA issue type	Stash branch type
Bug	Bugfix
Story	Feature
New Feature	Feature

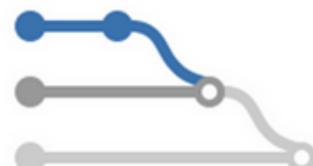

Once the new branch is created, Stash takes you to the file listing for that. You can now pull to your local repository and switch to the new branch.

Automating the branch workflow

Stash can automate some merges in the branch workflow, based on the branching model for the repository. This allows merges to be cascaded to newer branches of the same parent, subject to a few conditions, so reducing the need for manual maintenance of branches.

As a project administrator you can turn on automatic merging for a particular repository. Go to **Settings > Branching model** for the repository, and select **Enable automatic merging** (under 'Automatic merge').

If Stash cannot perform an automatic merge, perhaps because branch permissions prevent it, Stash creates a new pull request for that merge, and the automatic merge operation stops. This allows you to resolve the conflict locally before approving the new pull request, which may involve further cascading merges.

See [Automatic branch merging](#) for more information about the conditions for automatic merging, and how Stash determines the ordering of branches.

Managing all your branches

The branch listing page makes it easy to keep track of all the branches in your repository.

Searching for branches

You can easily find branches by using the search at the top of the table. Furthermore, if you're using the [Stash branch model](#), you can filter by branch type simply by searching for the prefix – for example, search for "feature/" to see all your feature branches.

You can find the feature and bugfix branches that haven't yet been merged into a particular release (for example, "release/2.10") by changing the 'base branch' – just use the branch selector (arrowed in the screenshot below) to change the base branch, and refer to the **Behind/Ahead** and **Pull requests** columns.

Reading the table

Behind/Ahead

The Behind/Ahead column shows by how many commits a branch has diverged from the 'base branch' (for example, `master`). Use the branch selector (arrowed in the screenshot below) to change the base branch.

Pull requests

The Pull requests column shows the most relevant status from the pull requests against each branch – click an icon to see details. The status is:

- OPEN if there is at least one open pull request.
- MERGED if there are no open pull requests, and at least one pull request has been merged.
- DECLINED if there are no open or merged pull requests, and at least one pull request has been declined.

Builds

If you have an [integrated build server](#), the Builds column shows the status of the latest build results published to Stash. The overall status is 'passed' if all the different builds (for example, unit tests, functional tests, deploy to staging) succeeded and 'failed' if at least one run failed for any of those. Click an icon to see details of the builds.

Actions

The Actions menus include tasks for working with branches:

- Check out in SourceTree
- Create a pull request
- Edit permissions
- Delete branch

Navigation

Choose **Keyboard shortcuts** from the Stash Help menu to see shortcuts to help you navigate quickly around the branch listing.

Checking on your branches

The branch listing allows you to:

- See how many commits behind or ahead your branch is compared to a chosen 'base branch'.
- See the latest status for pull requests originating from branches.
- See the build status of branches at a glance.
- The **Pull requests** status helps you to track the review and merge work that still needs to be done and can help with branch cleanup. For example, in combination with the **Behind/Ahead** information, you

can decide whether to remove a feature branch that has already been merged.

- The **Behind/Ahead** column can help you to identify work in progress as well as stale branches. It is calculated for each branch against the base branch.

Branches

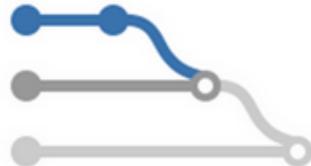

Branch	Behind/Ahead	Updated	Pull requests	Builds	Actions
STASHDEV-6754-plugin-setting-surrogate-key	23 246	Yesterday	OPEN	✓	...
master	17	38 mins ago	DECLINED	!	...
release/3.0	BASE BRANCH	38 mins ago	MERGED		...
fe-api	71 24	39 mins ago	OPEN		...
bugfix/STASHDEV-6778-compare-on-identical-refs	63 2	1 hour ago	OPEN	✓	...
bugfix/STASHDEV-6813-viewport-indicator-is-visible	13 3	1 hour ago	OPEN	✓	...
bugfix/STASHDEV-6811-misleading-cursor	23 10	1 hour ago	OPEN	!	...

Automatic branch merging

Stash can automatically merge changes to newer release branches, thus reducing the need for manual maintenance of branches. To be able to do this, Stash has to be able to determine the [ordering of branches](#), and relies on [semantic versioning](#) of branch names – for example Stash will order these branch names like this: 1.0.0 < 2.0.0 < 2.1.0 < 2.1.1.

Note that:

- Automatic branch merging is subject to a few [conditions](#).
- Automatic merging is off by default for new and existing repositories.
- You must explicitly enable automatic merging for each repository.
- The commit message will indicate that the merge was automatic.
- Stash records full audit log entries for automatic merges.

As a project administrator, turn on automatic merging by going to **Settings > Branching model** for a repository, and selecting **Enable automatic merging** (under 'Automatic merge').

On this page:

- Conditions for automatic merging
 - What happens if the automatic merge fails?
- Branch ordering algorithm
- Ordering examples

Conditions for automatic merging

The following conditions must be satisfied for Stash to be able to automatically cascade changes:

- The Stash [branching model](#) must be configured for the repository.
- The 'release' branch type must be enabled or a production branch must be set for the repository.
- The merge must go via a pull request.
- The pull request must be made to a branch that is of the 'release' type.
- The target branch of the pull request must have branches that are [newer](#) than it.

What happens if the automatic merge fails?

The automatic merge can fail for reasons such as:

- Branch permissions prevent cascading changes to a particular branch.
- Stash detects a conflict that prevents the merge.
- There is already an open pull request with the same source and target that the automatic merge would close.

For the first two cases, Stash creates a new pull request for the failed merge, and the automatic merge operation stops. This allows you to resolve the conflict locally before approving the new merge, which may start a new series of cascading merges. Note that pull request that gets automatically opened when a merge fails won't trigger the continuation of the initial merge chain if resolved locally (which is the approach that we recommend).

Branch ordering algorithm

Stash is able to automatically merge changes to newer release branches, as long as Stash can determine the ordering of those branches. Ordering is based on [semantic versioning](#) in the naming pattern for branches.

Stash uses the following ordering algorithm to determine the branches in the merge chain:

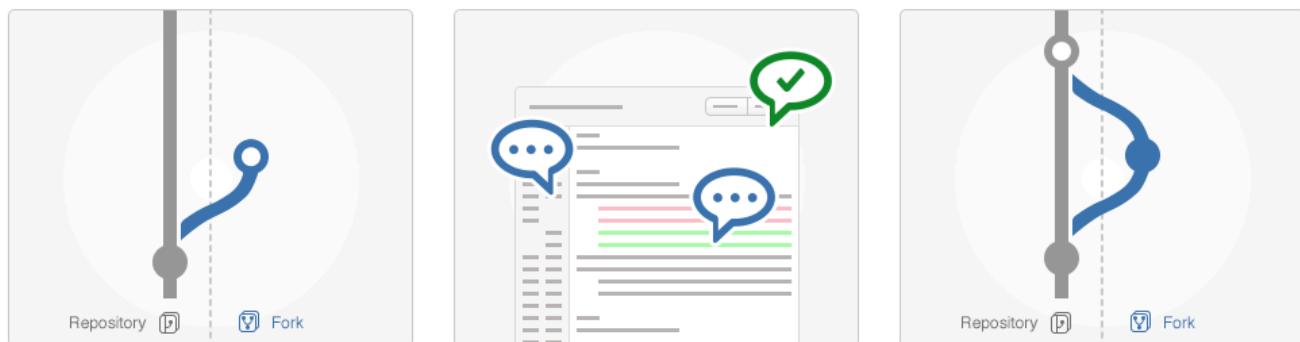

- Branches are selected and ordered on the basis of the name of the branch that started the cascade (i.e. the target of the pull request for the merge).
- Branch names are split into tokens using any of these characters: underscore '_', hyphen '-', plus '+' or period '.'.
- Only branches *matching* the name of the pull request target are added into the merge path. Matching means that every token before the first numeric token must be equal to the corresponding tokens of the target branch's name.
- Branches are ordered by number, if a given token is numeric. When comparing a numeric token with an ASCII token, the numeric is ranked higher (i.e. is considered as being a newer version).
- If both tokens are non-numeric, a simple ASCII comparison is used.
- In the unlikely case of the above algorithm resulting in equality of 2 branch names, a simple string comparison is performed on the whole branch name.
- There is a limit of 30 merges.

Ordering examples

The table below provides examples of branch naming patterns that Stash is able, and not able, to order correctly:

GOOD	<ul style="list-style-type: none"> • release/1.0 • release/1.1-rc1 • release/1.1 • release/1.2 • release/2.0 	Stash tokenises on the '.' and the '-' of '1.1-rc1' and is able to order these branch names correctly.
GOOD	<ul style="list-style-type: none"> • release/stash_1.1 • release/stash_1.2 • release/stash_2.0 	Stash tokenises on the '.' and the '_' and orders the numeric parts of these branch names correctly.
BAD	<ul style="list-style-type: none"> • release/1.0 • release/stash_1.1 	Stash tokenises on the '.' and the '_' but cannot recognise that 'stash_1.1' should follow '1.0'.

Using forks in Stash

Fork

Develop features on a branch and create a pull request to get changes reviewed.

Discuss

Discuss and approve code changes related to the pull request.

Merge

Merge the branch with the click of a button.

Forks provide an alternative workflow to using branches, for where particular developers have restricted (read-only) access to a repository. See [Workflow strategies in Stash](#) for more information.

You can fork a repository into any other project in Stash for which you have admin access. You can also create [personal forks](#) and give other developers access to that using repository permissions.

Creating a fork

You can create a fork for any repository that you can see in Stash (that is, for which you have 'read' permission).

Simply click **Fork** in the sidebar. You can choose the location for the newly forked repository. Note that when a repository is forked into another project it will get that project's permissions, which may be less restrictive.

When creating the fork you can enable [fork syncing](#) to have Stash automatically keep your fork up-to-date with changes in the upstream repository.

On this page:

- [Creating a fork](#)
- [Issuing a pull request for a fork](#)
- [Merging a fork](#)
- [Synchronizing with upstream](#)
- [Disabling forking](#)
- [Pre-receive hooks and forks](#)

Related pages:

- [Workflow strategies in Stash](#)
- [Controlling access to code](#)
- [Creating personal repositories](#)

Issuing a pull request for a fork

Pull requests for forks in Stash work just the way you'd expect. See [Using pull requests in Stash](#).

When creating the pull request, you can choose the fork and the branch that contains the source to be pulled, as well as the destination fork and branch.

Merging a fork

Once a pull request has been approved by reviewers, it can be merged as usual. See [Using pull requests in Stash](#).

Synchronizing with upstream

Once you fork a repository, your fork can be kept up-to-date with changes in the upstream repo either automatically by Stash or you can synchronize manually. You will still need to keep your remote working

repository synced with your fork in Stash yourself. See [Keeping forks synchronized](#) for more details.

Disabling forking

Forking of repositories is available by default. However, you can turn off forking, on a per-repository basis, if this helps you to control your development process. You can do this on the **Repository details** tab of the repository settings.

Note that disabling forking on the parent repo doesn't delete any existing forks, and doesn't prevent those existing forks from being forked. Pull requests will still work from the existing forks. Furthermore, commits in the parent are viewable via the fork if the SHA1 hash is known to the user.

Pre-receive hooks and forks

Pre-receive hooks aren't copied with the fork and so are not run when code is merged in a pull-request. This means that custom hooks are unable to prevent certain changes from being merged by pull requests from forks. Instead, the hook would have to also implement a merge-check (see <https://developer.atlassian.com/stash/docs/latest/how-tos/repository-hooks.html>).

Keeping forks synchronized

Fork syncing helps you to keep your fork in Stash up-to-date with changes in the upstream repository. Stash can do this automatically for all branches and tags you haven't modified in the fork.

If you have modified branches or tags in the fork, Stash will offer syncing strategies. Stash will never update your branch or tag in your fork if this means that your changes would be lost.

Note that syncing is about pulling recent upstream changes into your fork, whereas pull requests are about pushing your changes back to the upstream repository.

On this page:

- [Enabling automatic fork syncing](#)
- [What gets synced?](#)
- [Manual synchronization strategies](#)

Enabling automatic fork syncing

You can enable automatic fork syncing when you first fork the repository:

Fork Stash / log-parser

Project * **Paul Watson**

Where would you like to fork this repository into?

Name * **log-parser**

The repository's name will be used to create its URL
<https://stash.dev.internal.atlassian.com/scm/~pwatson/log-parser.git>

Enable fork syncing

Keep branches and tags automatically in sync with [Stash / log-parser](#).

Fork repository **Cancel**

You can also enable fork syncing at any later time by going to **Settings > Fork syncing** for the forked repository. Syncing is disabled by default.

What gets synced?

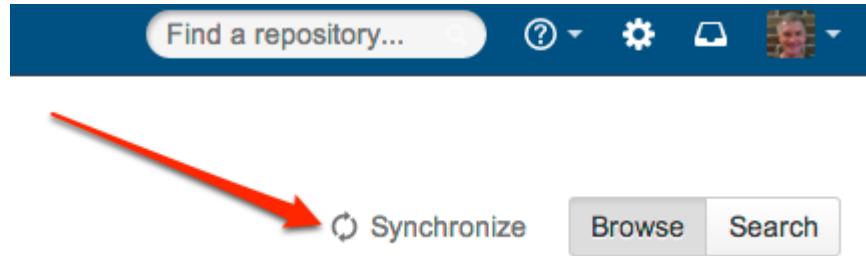

When performing automatic synchronization, Stash updates the fork as follows:

- for branches - Stash makes any fast-forward change, where there is no need to merge work and there is no risk of losing changes.
- for tags - Stash makes updates only if the current state is the same as what upstream pointed to. So, a new tag in upstream will create a new tag in the fork, unless you have a tag of the same name, when the update will fail.

Manual syncing

If upstream and your fork have diverged, so that each has changes that are not in the other, Stash will not perform a merge automatically. When you visit the branch in Stash, you have the option to manually synchronize the branch.

You can manually synchronize your branch at any time using **Synchronize** by going to the **Settings > Fork syncing** tab for the forked repository, or on either of the **Source** or **Commits** tabs for a repository:

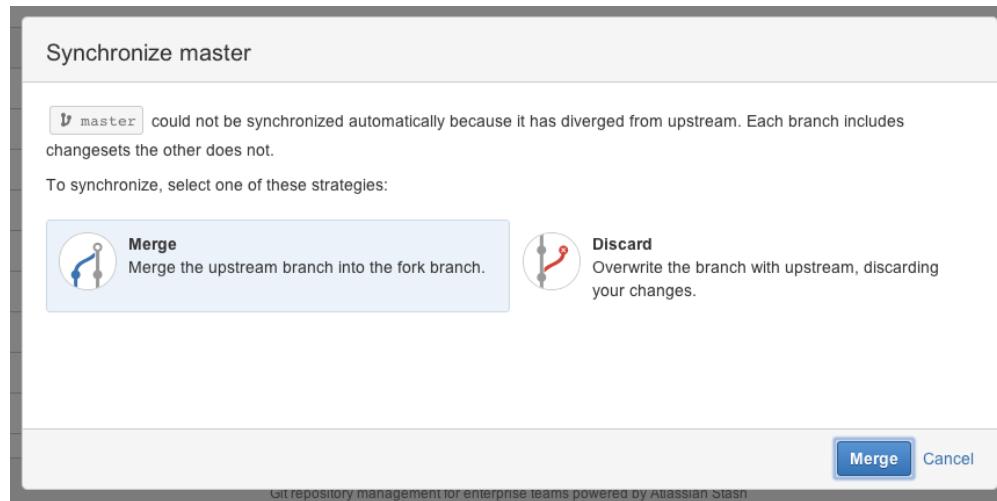

Manual synchronization strategies

When you initiate a manual synchronization, Stash will ask you to choose one of the following synchronization strategies.

Merge strategy

Merge the upstream branch into the fork branch.

If Stash detects conflicts when trying to perform the merge it will offer hints on how to resolve those:

Merge conflicts

Upstream changes could not be merged in automatically due to conflicts in the following file:

- CLI feature.txt

How to perform a manual merge:

Step 1: Fetch changes from the upstream repository (saving the upstream branch as `FETCH_HEAD`).

```
git fetch https://stash.dev.internal.atlassian.com/scm/dox/toolbox.git master
```

Step 2: Checkout the fork branch and merge in the changes from the upstream branch. Resolve conflicts.

```
git checkout master
git merge FETCH_HEAD
```

Step 3: After the merge conflicts are resolved, stage the changes accordingly, commit the changes and push.

```
git commit
git push https://stash.dev.internal.atlassian.com/scm/-pwatson/toolbox.git HEAD
```

[Close](#)

Once the merge is complete, your branch will have incorporated all the commits on the branch in the parent repository, but your branch will still be ahead of the parent (it has your changes on it). This means automatic synchronization for this branch will not occur until your changes are pushed to the parent repository.

Discard strategy

Overwrite your changes in your fork with the upstream branch. Your changes will be lost.

Synchronize master

b master could not be synchronized automatically because it has diverged from upstream. Each branch includes changesets the other does not.

To synchronize, select one of these strategies:

Merge
 Merge the upstream branch into the fork branch.

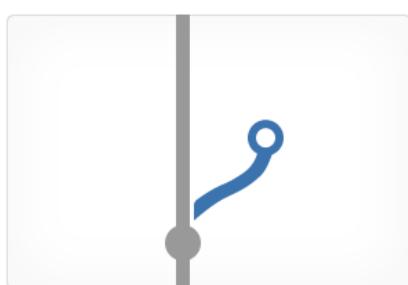

Discard
 Overwrite the branch with upstream, discarding your changes.

ⓘ Discarding means your changes will be lost

[Discard](#) [Cancel](#)

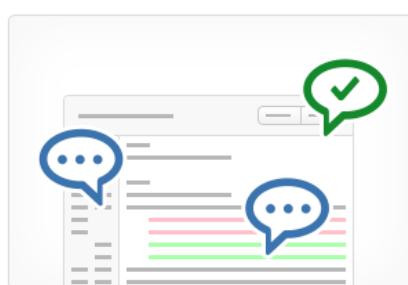

Git repository management for enterprise teams powered by Atlassian Stash

Using pull requests in Stash

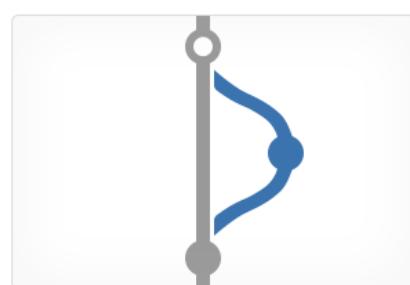

Branch

Develop features on a branch and create a pull request to get changes reviewed.

Discuss

Discuss and approve code changes related to the pull request.

Merge

Merge the branch with the click of a button.

Pull requests in Stash provide the team with a quick and easy way to review changes made on a branch, discuss those changes, and make further modifications before the branch is merged to master or your main development branch.

On this page:

- Creating a pull request
- Editing a pull request
- Discussing a pull request
- Merging a pull request
- Watching and notifications

Related pages:

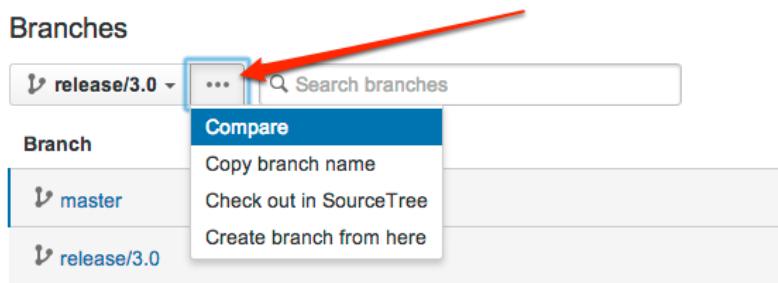

- Checks for merging pull requests

Creating a pull request

When you are ready to start a discussion about your code changes, simply create a pull request.

To create a pull request:

1. You've pushed your changes to Stash, right?
2. Now, go to the repository in Stash. Either click **Create pull request** in the sidebar, or choose **Compare** from the Actions menu (when on the Source, Commits or Branches pages):

3. Choose the source and destination branches. The source branch is where you made your code changes and the destination is the branch you want to merge to. The source and target branches may be located in different forks:

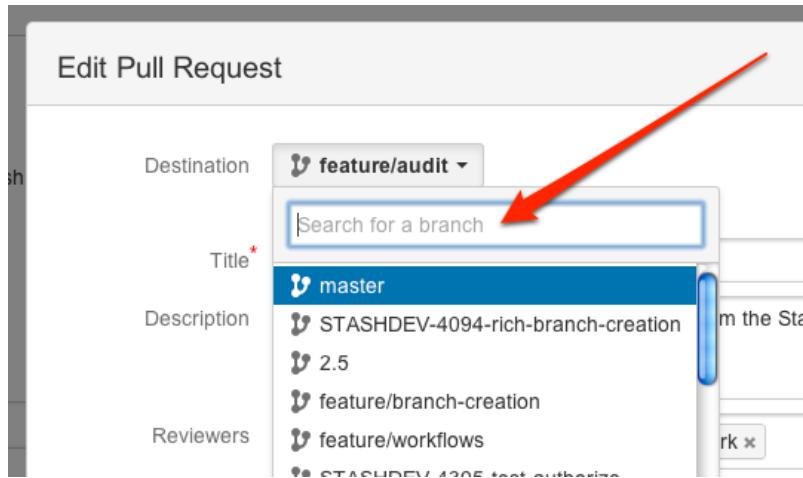

4. Use the Diff and Commits tabs (see below) to compare the source and destination branches, before creating the pull request.
5. Click either **Create pull request**, or **Continue**, and enter a title and description that will help people understand what your pull request is about. You can use **mentions** (to notify another Stash user), and **markdown** (to add formatting) in your description.
6. Add reviewers – they will receive a notification by email. Other people who have **permissions** on the project can participate in the discussion if it interests them.
7. Click **Create**.

You will receive email notifications when your reviewers and other participants comment on the pull request, or commit changes to it.

Editing a pull request

After creating a pull request, you can modify it by clicking **Edit** on the pull request's page. You can edit details such as the **Title**, **Description** and the **Reviewers**. In particular, you can change the **Destination** branch for the

pull request – you'll need Read permission on the branch you want to set.

Discussing a pull request

The most important thing about a pull request is the discussion that it generates. With Stash, you can comment on the pull request as a whole, a particular file, and on specific lines of code in a file. Furthermore, you can attach a task to any comment, so actions identified during the review can be easily tracked and resolved. Read more about [pull request tasks](#) below.

To see all the pull requests for a repository, simply click **Pull requests** in the left-hand navigation panel (when viewing the repository).

To help you contribute to the discussion, Stash organises all the information about the pull request into 3 tabs: [Overview](#), [Diff](#) and [Commits](#):

Overview

The **Overview** tab captures all of the team's activity on the pull request in one place, right from the initial creation, through to when it is finally merged (or declined), with all the comments, replies and commits that happen along the way.

You can add a comment on the **Overview** tab (just under 'Activity'), or reply to a previous comment. Use [mentions](#) to alert another Stash user to your comment, and use [markdown](#) to add formatting, for example headings or lists.

Diff

Diffs for Stash pull requests provide the following advantages:

- The diff highlights the changes that will result when the merge occurs, so you can see exactly what the effect of the merge will be.
- The file tree on the left colour-codes files that have been added, changed or deleted, so you can quickly see the files you may need to review.
- As you'd expect, the diff for a file shows which lines of code have been added, deleted or modified.
- You can comment on the whole file by clicking the icon on the right in the diff header.
- You can comment directly on a line of code right in the diff, by hovering over the line, clicking the icon at the left, and entering your comment. Your comment will also appear in the activity.
- Comments in the diff are threaded, to allow meaningful and contextual conversations about your code.
- The **Side-by-side diff** option from the Action menu (arrowed below) lets you easily compare the changes that will be merged. Use the N (next) and P (previous) keyboard shortcuts to move between hunks in a diff. Use Shift+N (next) and Shift+P (previous) to move between comments in a diff. The 'map' in each margin of the side-by-side diff provides a visual summary of the diff hunks, and indicates which part of the

file you're currently viewing:

```

func-test / page-objects / src / main / java / stash / util / ElementUtils.java MODIFIED
 77     public static void scrollDocumentAndWa
 78         ElementUtils.waitUntilUpdated(element,
 79             @Override
 80             public void run() {
 81 -             scrollDocument(element);
 82         }
 83     });
 84 }
 85
 86 -     public static void scrollTo(String jqu
 87 -         element.javascript().execute("AJJS.
 88 -         try {
 89 -             Thread.sleep(10); //must wait
 90 -         } catch (InterruptedException e) {
 91 -             //nothing to do here
 92 -         }
 93 -     }
 94 -
 95     /**
 96      * Hacks the css of delete buttons so
 97      */
 98     public static void displayAllDeleteBut
 99         javascriptExecutor.executeScript("
100
101     }
102 }
103

```

- Search across all the files in a pull request, when viewing a pull request diff.

The search looks at the diff and surrounding code lines to provide context. The file tree on the left displays only the files returned by the search.

Use the 'f' keyboard shortcut to quickly access code search when viewing a diff in a pull request. The usual 'j' (next) and 'k' (previous) Stash shortcuts let you move between files in the search results. 'Esc' cancels the search.

22	22	stash.web.keyboardshortcut.changeset.hideediff.desc=Hide e-diff
23	23	stash.web.keyboardshortcut.changeset.hideediff=Changeset - Hide e-diff
24	24	stash.web.keyboardshortcut.changeset.ignorewhitespace.desc=Ignore whitespace
25	25	stash.web.keyboardshortcut.changeset.ignorewhitespace=Changeset - Ignore whitespace
26	+ 26	stash.web.keyboardshortcut.changeset.next.comment.desc=Next comment
27	+ 27	stash.web.keyboardshortcut.changeset.next.comment=Changeset - Go to next comment
28	28	stash.web.keyboardshortcut.changeset.next.file.desc=Next file
29	29	stash.web.keyboardshortcut.changeset.next.file=Changeset - Open next file
30	30	stash.web.keyboardshortcut.changeset.next.hunk.desc=Next change
31	31	stash.web.keyboardshortcut.changeset.next.hunk=Changeset - Go to next change
32	32	stash.web.keyboardshortcut.changeset.post.comment=Changeset - Submit Comment
33	+ 33	stash.web.keyboardshortcut.changeset.prev.comment.desc=Previous comment
34	+ 34	stash.web.keyboardshortcut.changeset.prev.comment=Changeset - Go to previous comment
35	35	stash.web.keyboardshortcut.changeset.prev.file.desc=Previous file

Commits

The **Commits** tab lists all the commits that will get merged. Clicking through to a commit takes you out of the pull request context.

When viewing a commit you can comment on the whole file, or a particular line of code, just as for a diff, for any file in the commit.

Participants can commit new changes to the branch. Stash auto-updates the **Commits** tab of the pull request, so you can see exactly which commits will be merged. Stash is smart about comments, moving them along when lines are added or removed. If a line with a comment gets removed, you can still view the comment in the activity, but Stash marks the diff as *outdated* to let you know that this piece of code has been changed in recent commits.

Pull request tasks

You can attach one or more tasks to any pull request comment, to track required work identified during a review.

```

269      -     if (update.getContext() != null && ObjectUtils.notEqual(i18nService.getMessage("task.create"), update.getMessage("task.create")))
270      -         throw new BadRequestException(i18nService.getMessage("task.create"));
271      -     }
272  217     if (update.getCreatedDate() != null && !update.getCreatedDate().isBefore(update.getModifiedDate()))

```

**Bryan Turner**

We're still validating too hard

Reply · Create task · 2 days ago

Decrease validation in TaskResource

Edit · Delete

Try highlighting some text in the comment, then clicking **Create task** – the task is automatically created and saved with that text.

When that task is done, simply check the box for the task.

To see all the unresolved tasks for a pull request, use Shift+T when viewing the pull request:

The screenshot shows a modal window titled "Tasks". Inside, there's a list of tasks with checkboxes. One task has a small link icon next to it. Below the list is a section titled "RESOLVED TASKS" containing several checked items. At the bottom left, there's a tip: "Tip: Use Shift + T to open the task list." and a "Close" button.

Click the 'link' icon for a task to see the task in the context of the comment and source code.

Note that:

- Anyone with permission to browse a pull request can create a task on any comment, and can browse, resolve and reopen existing tasks in the pull request.
- Repository admins and pull request authors can edit and delete *any* task in the pull request. Reviewers and others can only edit or delete their *own* tasks.
- A Stash administrator can set a merge check that requires all tasks to be resolved before the pull request can be merged. See [Checks for merging pull requests](#).

JIRA issues integration

When Stash is [integrated with JIRA](#) you can see the related JIRA issues right in the pull request. You'll see either the JIRA issue key, when there is just one, or the number of related issues:

The screenshot shows a pull request interface. At the top, there are buttons for 'Merge', 'Decline', 'Edit', and 'Approve'. Below these, it says '4 Reviewers' with four small profile icons, each marked with a green checkmark. A large red arrow points from the bottom left towards the 'Participants' and 'JIRA Issues' sections. Under 'Participants', it says '2 Participants'. Under 'JIRA Issues', it says '4 JIRA Issues'. Below these sections are links to 'Watch this pull request' and 'Learn more'.

Click an issue key to see details of the issue, such as the description, status and assignee, without having to leave Stash:

The screenshot shows a modal window titled 'JIRA Issues' for an issue key 'STASHDEV-6229'. The issue title is 'Fail builds when module dependencies out of order'. Below the title are buttons for 'QA', 'Close Issue', and 'Restart Progress'. The 'Details' section shows the issue type as 'Development Task', priority as 'Minor', status as 'TO BE REVIEWED', and assignee as 'Adam Ahmed [Atlassian]'. The 'Description' section contains the text: 'Can piggy back on the esprima stuff in the unused dependencies check.'

Click **the issue key** to see the issue in JIRA. This allows reviewers to gain important insight into the task that is being worked on, by seeing the comments and attachments on the issue. This also gives access into JIRA, so you can easily keep issues updated.

This screenshot is identical to the one above, showing the JIRA issue detail for 'STASHDEV-6229'. A red arrow points to the issue key 'STASHDEV-6229' in the title bar of the modal window.

Merging a pull request

Once you are ready to merge a pull request, and when the reviewers have approved it, simply click **Merge** at the top right of the pull request view. You can merge a pull request if you have write (or admin) permission on the project.

Stash does not enforce particular review workflows, so, for example, anyone with write permission on the repository can merge a pull request, including the person who opened it. This flexibility allows different teams to have different approaches to using Stash. If your team requires stricter control, consider using **branch**

permissions to restrict who can merge a pull request to particular users or groups. You might also want to consider using a plugin to enforce a particular workflow, for example to ensure that only approvals from members of your review team allow merging. See [Checks for merging pull requests](#).

Pull request

The screenshot shows a pull request details page. At the top right, there are four buttons: 'Merge' (highlighted with a red arrow), 'Decline', 'Edit', and 'Approve'. Below these buttons, it says '3 Reviewers' followed by three small user icons. The main content area shows the pull request title 'Bugfix/STASHDEV-6789 branch compare kb shortcut' and a summary of changes. It includes a 'Details' section with a list of commits and a 'Watch this pull request' link.

In the 'Merge Pull Request' dialog, you can check **Delete branch** if you no longer need that branch in the repository. Stash checks on a few things before allowing the deletion – the branch being merged will not be deleted if:

- The branch is the default repository branch.
- The user does not have permission to delete the branch.
- The branch is subject to an open pull request.

The screenshot shows a modal dialog titled 'Merge Pull Request'. It displays the source and target branches for the merge. At the bottom, there is a checkbox labeled 'Delete branch' (highlighted with a red arrow) and two buttons: 'Merge' and 'Cancel'.

Once accepted, the pull request is marked as merged on the **Pull requests** tab.

If Stash detects a conflict that prevents the merge, notifications are displayed on the **Overview** and **Diff** tabs of the pull request. Click **More information** to see instructions for how to resolve the conflict in your local repository.

Watching and notifications

You automatically get added as a watcher of a pull request when you are added to the pull request as a reviewer, or when you perform an action related to the pull request (such as adding a comment):

Action	You are added as a watcher
You are added as a reviewer	✓
You comment on a pull request	✓
You reply to a comment	✓
You push to the source branch	✓
You approve the pull request	✓

You can manually add yourself as a watcher by clicking the **Watch** button on the pull request screen.

You can always stop watching a pull request by clicking the link in the email notification, or the **Unwatch** button on the pull request screen. If you stop watching a pull request you will not automatically be added as a watcher again if you subsequently perform an action that would otherwise have added you.

Stash sends email notifications to watchers when certain [pull request events](#) occur. By default, email notifications are batched, but you can change your personal account settings (on the **Notification settings** tab) so that you get notifications immediately. Note that notifications are *always* sent immediately:

- To the reviewers when a pull request is created.
- To a user when they are added as a reviewer to a pull request.
- To a user when they are mentioned in the description of a pull request.

See [Notifications](#) for details.

Checks for merging pull requests

To help customise your workflow, you can set checks to control when a pull request can be merged. Pull requests cannot be merged if the required checks have not been met. These checks are set separately on each repository in a Stash project.

You'll need either project admin, admin or sys-admin [permissions](#) to set merge checks for pull requests.

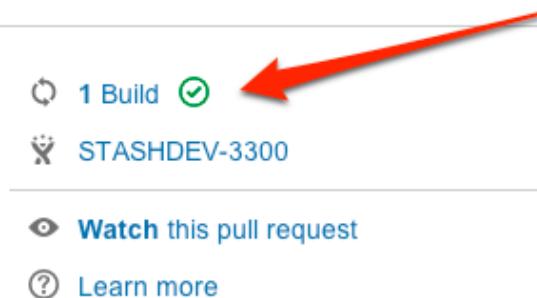

So, to set merge checks for pull requests, go to a repository in a project and choose **Settings > Pull requests**. Stash includes the merge checks described below, or you can write your own [merge request check plugin](#).

Requires a minimum number of successful builds

Select this option to stop pull requests from being merged if they have any unsuccessful builds. For a pull request, this checks builds that run against the latest commit on the source branch.

You must also specify a minimum number of builds - the pull request will not be able to be merged until at least this many builds have completed. Ideally, you should set this to the number of different builds that are configured to run against the branches in your repository.

See [Bamboo integration](#) for more information about integrating Stash with your build server.

The number of builds, and the latest result, for the head commit of a branch.

Requires a minimum number of approvers

Select this option to block merging of a pull request until it has been approved by at least the selected number of participants.

Requires all tasks to be resolved

Select this option to stop a pull request from being merged if any review tasks are still unresolved. Read more about [pull request tasks](#).

Pull requests

Requires approvers
At a minimum, pull requests must be approved by the number of users above before it can be merged

Requires all tasks to be resolved

Requires a minimum of successful builds
If there are more than the specified number of builds, all of them will have to be successful in order to merge the pull request

Save **Cancel**

Notifications

An email server must be configured in Stash for email notifications to be sent. See [Setting up your mail server](#). Note that if the mail server fails, notifications will be dropped. See also [HipChat notifications](#).

Pull request notifications

Stash sends email notifications to the [watchers](#) and reviewers of a pull request when the following events occur:

Pull request event	Notification
A reviewer is added	IMMEDIATE
A comment is added	BATCHED
A comment is edited	BATCHED
A comment is replied to	BATCHED
A commit is made to the source branch	BATCHED
A pull request is opened	IMMEDIATE
The pull request is approved	BATCHED
The pull request is merged	BATCHED
The pull request is declined	BATCHED
The pull request is reopened	BATCHED or IMMEDIATE

By default, email notifications are [batched](#). However, in the following situations notifications are sent immediately:

- When a pull request is first opened, notifications are immediately sent to the reviewers.
- When a pull request is reopened, notifications are immediately sent to the reviewers who have opted in for immediate notifications.
- When someone is added as a reviewer to a pull request, a notification is immediately sent to them.
- When someone is mentioned in the description of a pull request, a notification is immediately sent to them.

You can change your personal account settings (on the [Notification settings](#) tab) so that you get notifications

immediately.

You don't receive notifications for events you initiate yourself. See also [Using pull requests in Stash](#).

Batched email notifications

Stash sends email notifications to the watchers of a pull request, when certain [pull request events](#) occur, and to those who are mentioned in pull request descriptions or comments.

Notifications are aggregated by user for each pull request and are emailed in a batch. The batch gets sent if things go quiet for a while (10 mins by default), or when the oldest notification gets 'stale' (30 mins by default), whichever comes first.

By default, email notifications are batched, however:

- You can change your personal account settings (on the [Notification settings](#) tab) so that you get notifications immediately.
- A Stash admin can configure the period of inactivity and the staleness timeout period in the [Stash config properties file](#).
- A Stash admin can change the notification mode for the Stash instance to 'immediate' using a [system property](#), but users can still opt in for batched notifications.

Using 'mentions' to notify someone

From Stash 2.0 you can use 'mentions' to notify another Stash user about the pull request description or comment you are writing. Stash sends an email to that person – the emails are [batched](#) if they have opted for batching in their personal account settings.

To use mentions, simply start typing '@' and then the users display name, username or email address, and choose from the list that Stash offers. You can use quotes for unusual names, for example if it has spaces. Use Control-Shift-P or Command-Shift-P to preview the mention.

HipChat notifications

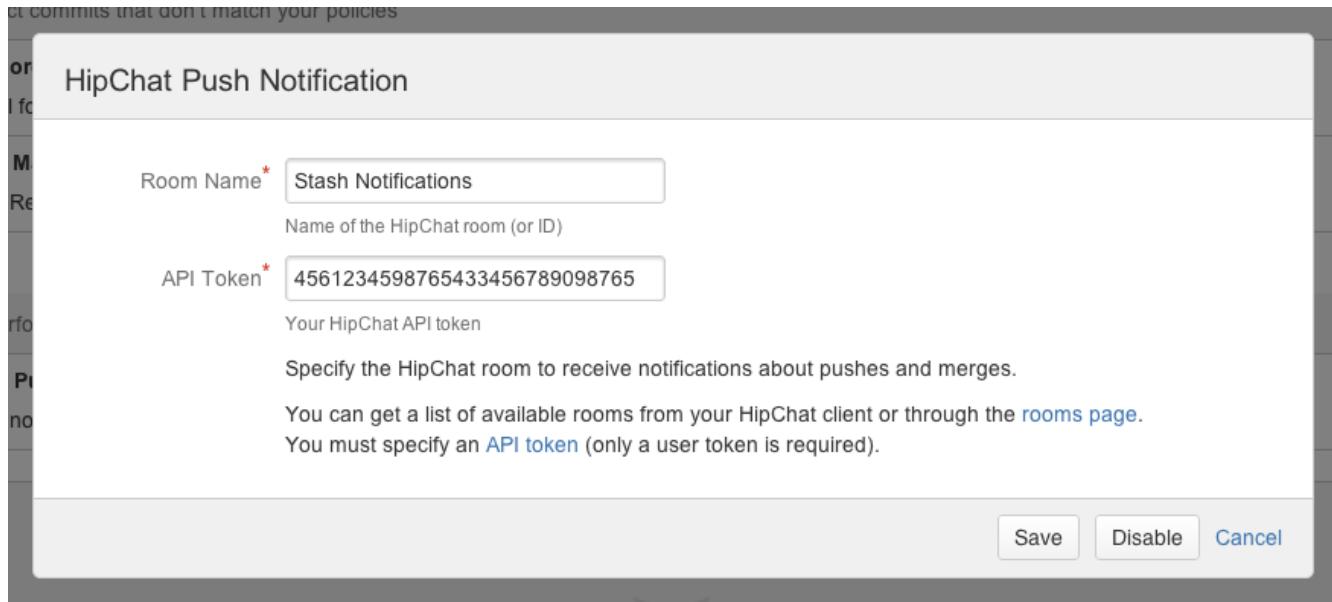

Stash can send an IM notification to a HipChat room whenever someone pushes to a repository. HipChat notifications are implemented as a [post receive hook](#) in Stash, and are available to all repos in Stash.

You can enable and disable HipChat notifications for a particular repo by going to [Settings > Hooks](#) for the repo:

Settings

Repository details Hooks Add hook Learn more Pull requests Branching model Audit log Access keys PERMISSIONS Repository Branch	<p>Hooks Add hook Learn more</p> <p>Hooks allow you to extend what Stash does every time the repository changes (for example, when new code is pushed or when a pull request is merged). Hooks are installed by the system administrator and can be enabled by project administrators on a per-repository basis.</p> <p>Pre receive - reject commits that don't match your policies</p> <p> Reject Force Push Reject all force pushes (git push --force) to this repository Disabled Enabled</p> <p>Post receive - perform actions after commits are processed</p> <p> HipChat Push Notification Edit Sends a notice to the specified HipChat room whenever someone pushes to the repository Disabled Enabled</p>
---	---

You need to specify the API token and the name of the HipChat room:

Talk to your HipChat administrator to get the API token for your HipChat server.

Here's an example of what you might see, from our own HipChat room:

Stash	Tim Pettersen committed to 1 branch at Stash/stash On branch "STASHDEV-3418-hook-tx" - Merge branch 'STASHDEV-3418-hook-tx' of ssh://stash-dev.atlassian.com... (48327864b3f4) - STASHDEV-3418: use Operation instead of TransactionCallback (2367aab05eb0)	3:10 PM
Bamboo	Stash > Pull Request Build > STASHDEV-3418-hook-tx #2 passed. 2893 passed. Changes by Charles O'Farrell	3:12 PM
Stash	Charles O'Farrell committed to 1 branch at Stash/stash On branch "2.2" - Merge pull request #1160 from feature/repo-hooks/wrm-reject-error-handling to ... (96368e3ae3c0) - NONE: Use html instead of empty/append (64bb2fa9817a) - NONE: Handle dynamic soy errors when showing dialog (84824e46981f)	3:13 PM
Stash	Charles O'Farrell committed to 1 branch at Stash/stash On branch "master" - Automatic merge from 2.2 -> master * commit '96368e3ae3c0c014a8590552...' (9cc20cbd552d) - Merge pull request #1160 from feature/repo-hooks/wrm-reject-error-handling to ... (96368e3ae3c0) - NONE: Use html instead of empty/append (64bb2fa9817a) - NONE: Handle dynamic soy errors when showing dialog (84824e46981f)	3:13 PM

Markdown syntax guide

By default, Stash uses [Markdown](#) as its markup language. You can use markdown in the following places:

- any pull request's descriptions or comments, or
- in [README](#) files (if they have the .md file extension).

Use [Control-Shift-P](#) or [Command-Shift-P](#) to preview your markdown.

Markdown syntax

The page below contains examples of Markdown syntax. For a full list of all the Markdown syntax, consult the official documentation on John Gruber's [Daring Fireball](#) site.

Headings

```
# This is an H1
## This is an H2
##### This is an H6
```

On this page:

- Markdown syntax
 - Headings
 - Paragraphs
 - Character styles
 - Unordered list
 - Ordered list
 - List in list
 - Quotes or citations
 - Inline code characters
 - Code blocks
 - Links to external websites
 - Linking issue keys to JIRA
 - Images
 - Tables
- README files

Paragraphs

Each paragraph begins on a new line. Simply press <return> for a new line.

For example,
like this.

You'll need an empty line between a paragraph and any following markdown construct,
such as an ordered or unordered list, for that to be rendered. Like this:

```
* Item 1  
* Item 2
```

Character styles

```
*Italic characters*  
_Italic characters_  
**bold characters**  
__bold characters__
```

Unordered list

```
* Item 1  
* Item 2  
* Item 3  
  * Item 3a  
  * Item 3b  
  * Item 3c
```

Ordered list

```
1. Step 1
2. Step 2
3. Step 3
  a. Step 3a
  b. Step 3b
  c. Step 3c
```

List in list

```
1. Step 1
2. Step 2
3. Step 3
  * Item 3a
  * Item 3b
  * Item 3c
```

Quotes or citations

Introducing my quote:

```
> Neque porro quisquam est qui
> dolorem ipsum quia dolor sit amet,
> consectetur, adipisci velit...
```

Inline code characters

Use the backtick to refer to a `function()`.

There is a literal ``backtick (`)`` here.

Code blocks

Indent every line of the block by at least 4 spaces or 1 tab. Alternatively, you can also use 3 backtick quote marks before and after the block, like this:

```
```
Text to appear as a code block.
````
```

Within a code block, ampersands (&) and angle brackets (< and >) are automatically converted into HTML entities.

This is a normal paragraph:
This is a code block.
With multiple lines.

Links to external websites

```
This is [an example](http://www.slate.com/ "Title") inline link.  
[This link](http://example.net/) has no title attribute.
```

Linking issue keys to JIRA

When you use JIRA issue keys (of the default format) in comments and pull request descriptions Stash automatically links them to the JIRA instance.

The default JIRA issue key format is two or more uppercase letters ([A-Z][A-Z]+), followed by a hyphen and the issue number, for example STASH-123.

Images

Inline image syntax looks like this:

```
![Alt text](/path/to/image.jpg)  
![Alt text](/path/to/image.png "Optional title attribute")  
![Alt text](/url/to/image.jpg)
```

For example:

```
...  
![Mockup for feature A](http://monosnap.com/image/b0cxxxxLGF.png)  
...
```

Reference image links look like this:

```
![Alt text][id]
```

where 'id' is the name of a previously defined image reference, using syntax similar to link references:

```
[id]: url/to/image.jpg "Optional title attribute"
```

For example:

```
...  
--Collected image definitions-->  
[MockupA]: http://monosnap.com/image/b0cxxxxLGF.png "Screenshot of Feature A  
mockup"  
...  
<!--Using an image reference-->  
![Mockup for feature A][MockupA]  
...
```

Tables

| Day | Meal | Price |
|---------|---------|-------|
| Monday | pasta | \$6 |
| Tuesday | chicken | \$8 |

You can also use HTML...

Inline HTML

An example, to add a table:

This is a regular paragraph.

```
<table>
  <tr>
    <td>Foo</td>
  </tr>
</table>
```

This is another regular paragraph.

Note that Markdown formatting syntax is not processed within block-level HTML tags. That is, you can't use Markdown-style *emphasis* inside an HTML block.

See <http://daringfireball.net/projects/markdown/syntax#html> for more details.

README files

From Stash 1.3, you can document a project right in the repository by creating .md or .txt files. If the ReadMe has the .md extension, any [Markdown](#) it contains gets rendered straight to the screen when viewed from the file list of the repository.

The screenshot shows a GitHub repository interface. On the left, there's a file tree with files like LICENSE, logparser.cabal, README.md (which is highlighted with a red box), rebuild.sh, regenerate-graphs.sh, Setup.lhs, and test.sh. A red arrow points from the README.md file in the tree down to its rendered content below. The rendered content includes a section titled "Build" with instructions to run cabal configure and cabal build, and a section titled "Tests" with instructions to run cabal configure --enable-tests, cabal build, and cabal test.

LICENSE

logparser.cabal

README.md

rebuild.sh

regenerate-graphs.sh

Setup.lhs

test.sh

README.md

Build

To build the logparser run

```
$> cabal configure
$> cabal build
```

If any of the dependencies are missing run:

```
$> cabal install --only-dependencies
```

Tests

Enable tests

```
$> cabal configure --enable-tests
$> cabal build
$> cabal test
```

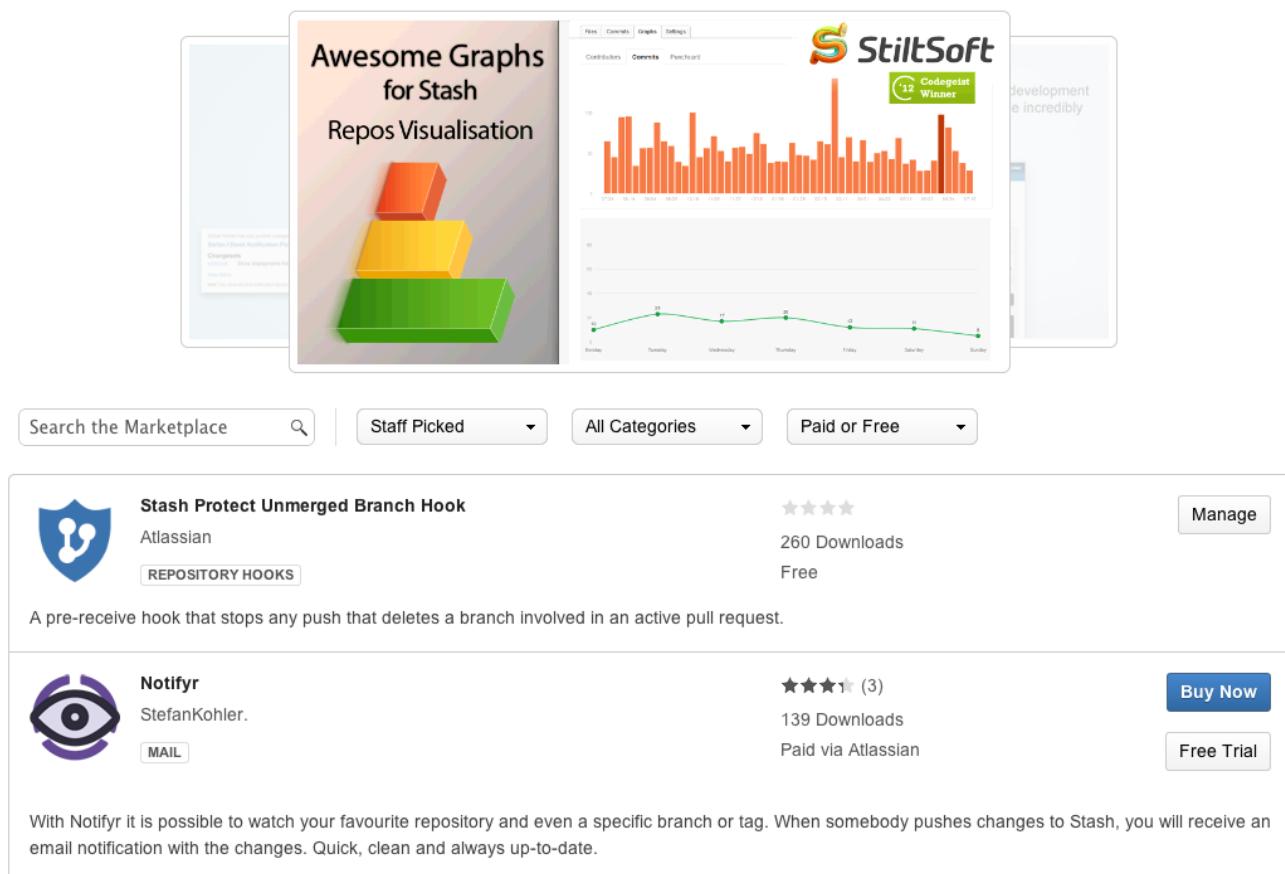

Requesting add-ons

The [Atlassian Marketplace](#) website offers hundreds of add-ons that the administrator of your Atlassian application can install to enhance and extend Atlassian products, including Stash. If the add-on request feature is enabled for your Stash instance, you can submit requests for add-ons from the Marketplace to your Stash administrator.

The 'Atlassian Marketplace for Stash' page provides an integrated view of the Atlassian Marketplace from within your Stash instance. The page offers the same features as the Marketplace website, such as searching and category filtering, but tailors the browsing experience to Stash.

Atlassian Marketplace for Stash

Find and request powerful add-ons compatible with your Stash version on this streamlined Atlassian Marketplace. [Manage add-ons](#).

The screenshot shows the Atlassian Marketplace for Stash interface. At the top, there's a search bar labeled "Search the Marketplace" with a magnifying glass icon, and dropdown menus for "Staff Picked", "All Categories", and "Paid or Free". Below the search area, there are two main sections displaying add-ons:

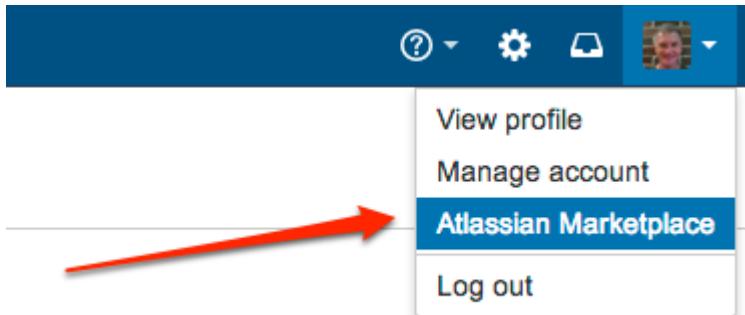

- Awesome Graphs for Stash**: This section features a large image of three stacked 3D bars in orange, yellow, and green. It includes a heading "Awesome Graphs for Stash" and "Repos Visualisation". To the right is a chart titled "StiltSoft" showing commit counts over time, with a badge indicating it's a "Codegeist Winner".
- Stash Protect Unmerged Branch Hook**: This section shows a shield icon, the name "Stash Protect Unmerged Branch Hook" by "Atlassian", and a "REPOSITORY HOOKS" button. It has a rating of 5 stars, 260 downloads, and is marked as free. A description below states: "A pre-receive hook that stops any push that deletes a branch involved in an active pull request."
- Notifyr**: This section shows an eye icon, the name "Notifyr" by "StefanKohler.", and a "MAIL" button. It has a rating of 3 stars, 139 downloads, and is marked as paid via Atlassian. A description below states: "With Notifyr it is possible to watch your favourite repository and even a specific branch or tag. When somebody pushes changes to Stash, you will receive an email notification with the changes. Quick, clean and always up-to-date."

This in-product view of the Marketplace gives day-to-day users of Atlassian applications, not just administrators, an easy way to discover add-ons that can help them get work done. When you find an add-on of interest, you can submit a request to your administrator for the add-on with just a few clicks.

Submitting an add-on request

To browse for add-ons in the Atlassian Marketplace, follow these steps:

1. From anywhere in the application, open your profile menu and choose **Atlassian Marketplace**:

2. In the Atlassian Marketplace page, use the search box to find add-ons or use the category menus to browse or filter by add-ons by type, popularity, price or other criteria. You can see what your fellow users have requested by choosing the **Most Requested** filter.
3. When you find an add-on that interests you, click **Request** to generate a request for your administrator.
4. Optionally, type a personal message to your administrators in the text box. This message is visible to administrators in the details view for the add-on.

The screenshot shows the Atlassian Marketplace interface. In the center, a modal dialog box titled "Request an Add-on" is open for the "Source Code Importer for Atlassian Stash" add-on. The dialog contains a message about requesting the add-on and a text input field with the placeholder "Please enter an optional message with your request:" followed by the text "This looks good! Let's give it a try, please.". At the bottom of the dialog is a blue "Submit Request" button. In the background, there are other add-on cards, such as "SVN Importer for Atlassian Stash" by TMate Software and "Badgr" by Stefankohler.

5. Click **Submit Request** when done.
6. Click **Close** to dismiss the 'Success!' message dialog box.

At this point, a notification appears in the interface your administrators use to administer add-ons. Also your request message will appear in the add-on details view, visible from the administrator's 'Find New Add-ons' page. From there, your administrator can purchase the add-on, try it out or dismiss requests.

Updating an add-on request

After submitting the request, you can update your message at any time. Click the **Update Request** button next to the listing in the Atlassian Marketplace page to modify the message to your administrator.

The administrator is not notified of the update. However, your updated message will appear as you have modified it in the details view for the add-on immediately.

Integrating Stash with Atlassian applications

When you integrate Stash with Atlassian applications you get the following benefits:

| Application | Integration feature | Compatibility | |
|--|---|-----------------|-----------------------------------|
| 
 | Related branches, commits and pull requests are all summarized in the Development panel in a JIRA issue. | JIRA 6.2+ | Stash 2.10+ |
| | Create Git branches from within JIRA and JIRA Agile. | JIRA 6.1+ | Stash 2.8+ |
| | Transition JIRA issues from within Stash. | JIRA 5.0+ | Stash 2.7+ |
| | See the JIRA issues related to Stash commits and pull requests | JIRA 5.0+ | Stash 2.1+ |
| | See all the files committed for the issue (on the JIRA Source tab). | JIRA 5.0.4+ | Plugin version bundled in JIRA |
| | Click through to see a changed file, or the full commit, in Stash. | JIRA 5.0–5.0.3 | JIRA FishEye/Stash Plugin 5.0.4.1 |
|  | <p>When you have SourceTree installed, you can:</p> <ul style="list-style-type: none"> clone a Stash repository using SourceTree. check out a branch in SourceTree, when viewing files, commits or branches in a Stash repository. | SourceTree 1.7+ | Stash 2.7+ |
|  | <p>Bamboo responds to repository events published by Stash to:</p> <ul style="list-style-type: none"> Trigger a plan build when a developer pushes to the connected repository. JIRA integration

When Stash is integrated with Atlassian JIRA, you and your team get all these benefits:

- See all the related commits, branches and pull requests in a JIRA issue.
- Create Git branches from within JIRA and JIRA Agile.
- Transition JIRA issues automatically.
- Transition JIRA issues from within Stash.
- Use JIRA issue keys in Stash markdown.
- See the details for JIRA issues in Stash.
- See the JIRA issues related to Stash commits and pull requests.

Related pages:

- Linking Stash with JIRA
- JIRA FishEye-Stash Plugin compatibility
- Connecting to JIRA for user management

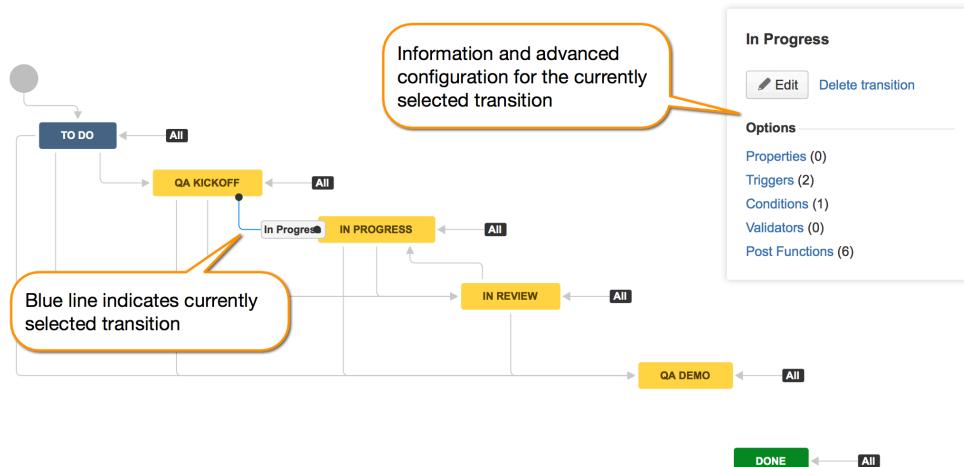

You can also use JIRA for delegated management of your Stash users. See [External user directories](#).

Your Stash administrator needs to set up [linking with JIRA](#) before you'll see these work.

Transition JIRA issues automatically

STASH 3.2+
JIRA 6.3.3+

Your JIRA workflow can now respond to events in your linked development tools. For example, when a pull request is created, your JIRA workflow can be configured to automatically transition the related issue. Configure this from transitions within the JIRA workflow editor.

The events available in Stash are:

- Branch created
- Commit created
- Pull request created
- Pull request merged
- Pull request declined

See all related branches, commits and pull requests in a JIRA issue

STASH 2.10+

JIRA 6.2+

Get visibility into the Stash branches, commits and pull requests related to work on a JIRA issue, right in the context of the issue in JIRA (and JIRA Agile).

Development

 [Create Branch](#)

Stash will suggest the branch type and branch name, based on the JIRA issue type and summary – you can change these, of course.

Transition JIRA issues from within Stash**STASH 2.8+****JIRA 5.0+**

You can easily [transition](#) a JIRA issue from within Stash. For example, when creating a pull request you may want to transition the issue into review. Click on a linked JIRA issue anywhere in Stash to see a dialog with the available workflow steps:

The screenshot shows the 'JIRA Issues' screen in Stash. On the left, there's a list of JIRA issues: STASHDEV-1509 (status: Can't start Stash on Windows if trying to r...), STASHDEV-4809 (status: Release 2.7), STASHDEV-4847 (status: Update licensing plugin to 1.14), and ITPROJ-4 (status: This is an improvement for you to transit...). On the right, a detailed view of STASHDEV-4809 is shown. It has a 'Stash Dev / STASHDEV-4809' header and a 'Release 2.7' section. Below that is a button bar with 'Code Review', 'Reopen', and 'Close Issue'. A red circle highlights this button bar. To the right of the button bar is a 'Details' section with fields for Type (Development Task), Priority (Minor), Status (In Progress), and Assignee (Jason Hinch [Atlassian]). At the bottom is a 'Description' field containing a URL: <https://extranet.atlassian.com/display/STASH/Stash+2.7+Release+Checklist>.

Click on a step and complete the fields as required. If there are custom fields that are unsupported by Stash, just click **Edit this field in JIRA** to transition the issue directly in JIRA.

See issues from multiple instances of JIRA**STASH 2.7+**

Stash can link to more than one JIRA server at a time, so different teams can work with their own projects in different JIRA instances, or a single team can link to issues across multiple JIRA servers. Read more about [linking Stash with JIRA](#).

Use JIRA issue keys in markdown**STASH 2.7+**

When you mention a JIRA issue key in Stash, for example in a pull request description or a comment, the key gets automatically linked:

Details

Pierre-Etienne Poirot created a pull request 6 days ago

A project from a earlier innovation week, updated to leverage Michael Heemskerk's permissions improvements in 2.7 ([STASHDEV-2057](#)).

This will be merged after 2.7 is out, but the PR is opened to get early feedback.

Click on the linked key to see [details](#) for the issue.

See the details for JIRA issues

STASH 2.1+

JIRA 5.0+

Click a linked issue key anywhere in Stash to see the details of that issue in a dialog. And you can just click the issue key at the top of the dialog to go straight to the issue in JIRA:

JIRA Issues

Stash Dev / [STASHDEV-4754](#) Create branch information service

Reopen

Type: Story Priority: Minor Status: Closed Assignee: Charles O'Farrell [Atlassian]

Click through to JIRA

See the JIRA issues related to commits and pull requests

STASH 2.1+

JIRA 5.0+

Stash recognises JIRA issue keys in commit messages, and displays the keys as links on the Commits tabs for both the repository and [pull requests](#):

| Message | Commit Date | Issues |
|--|-------------|-------------------------------|
| STASHDEV-4785 - Upgrade stash inbox plugin to 1.3.2 with resources loaded asynchronously | 37 mins ago | STASHDEV-4785 |
| Automatic merge from 2.7 -> master * commit '664812515e74698423873e6a1fe6f84cd31db478': STASHD. | 1 hour ago | STASHDEV-4836 |
| Merge pull request #2161 in STASH/stash from ~MSTUDMAN/stash:STASHDEV-4836-disable-cancel-buttc. | 1 hour ago | STASHDEV-4836 |
| STASHDEV-4754 Switch to default-repository git zip for branch-info. The source build is restricted to pulling from the default repository. | 2 days ago | STASHDEV-4754 |
| STASHDEV-4816 Fixed missing space - breaking checks | 2 days ago | STASHDEV-4816 |
| STASHDEV-4836: jsHint fix | 2 days ago | STASHDEV-4836 |

Click on the linked key to see [details](#) for the issue.

Bamboo integration

When you integrate [Stash](#) with Atlassian's [Bamboo](#) build and deployment server, commit, branch, build and deployment information is shared for users of both applications.

On this page:

- Benefits of integration
- Configuration

Benefits of integration

Integration between Bamboo (versions 5.6 and later) and Stash (versions 3.1 and later) only requires:

- an application link to be configured between them, and
- a Stash repository to be specified in a Bamboo plan.

Bamboo is then automatically configured to respond to repository events published by Stash, and to notify Stash about build results – you don't have to configure repository polling for new commits anymore in Bamboo, or set up dedicated web hooks in your Stash instance.

Stash tells Bamboo when to build

- When a developer pushes to a repository the build is automatically started.

Stash tells Bamboo when to update plan branches to match changes in repository branches

- When a developer pushes a new branch to a repository a branch plan is automatically created.
- When a developer deletes a branch in a repository, the branch plan is automatically deleted or disabled.

Stash commits are displayed in the relevant Bamboo builds

- In Bamboo, you can view all of the commits involved in the build, allowing you to accurately track changes:

The screenshot shows a Bamboo build summary page. At the top, there's a navigation bar with tabs: Build summary, Tests, Commits, Artifacts, Logs, Metadata, Build Times, Issues, and Sandbox. The 'Commits' tab is selected. Below the tabs, the title 'Code commits' and 'Bamboo Master' are displayed. Two commits are listed:

- Marek Went (17 Jun 2014, 98e9d73...) - Merge branch 'mw_BAM-3491_agent_assignments'
- Marcin Oles (17 Jun 2014, 3a81041...) - Merge branch 'BDEV-4116-fixup'

- Simply click on a changeset to go to Stash, where you can see the commit diff for all of the files that are part of the build.

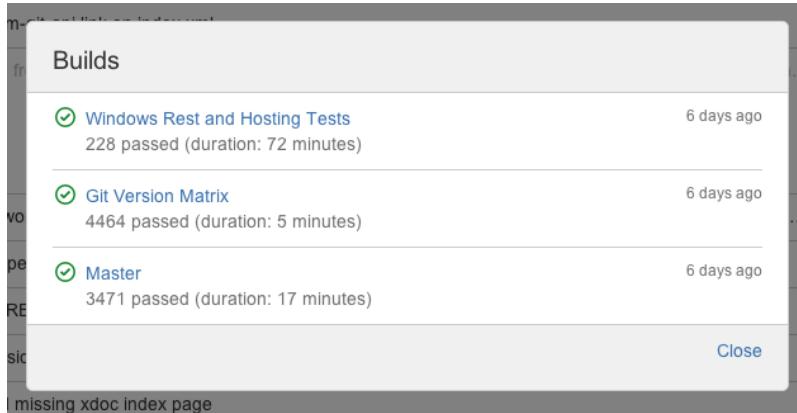

Bamboo notifies Stash automatically about build results

- Build notifications are automatically enabled when you link a build plan to a Stash repository.
- Notifications are sent to all linked Stash servers.
- You see the build results status for a commit when viewing any commit or pull request in Stash, so you can easily check the build status of a branch when deciding whether to merge changes:

The screenshot shows a Stash commit details page. The commit information is as follows:

| Commit Date | Issues | Builds |
|-------------------|---------------|---|
| 22 Jan 2013 | STASH-2798 | ✓ |
| 21 Jan 2013 | STASHDEV-3018 | ↻ (mouse cursor over the icon) |
| 21 Jan 2013 | STASHDEV-3018 | 3 builds passed (tooltip) |
| docs to master... | 21 Jan 2013 | STASHDEV-3021
STASHDEV-3020
STASHDEV-3018
STASHDEV-3016
STASHDEV-3010 |

- Click a build status icon in Stash to see further details:

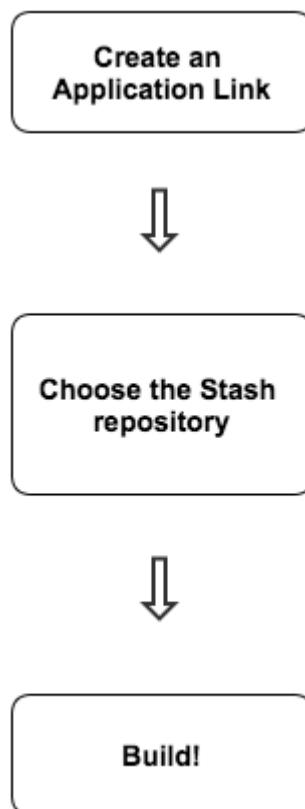

Stash displays the overall status of the build results. The status is 'passed' if all the different builds (for example, unit tests, functional tests, deploy to staging) have succeeded, and 'failed' if at least one run failed for any of those.

For example, when viewing the Commits tab for a Stash project, you will see icons that indicate the status of the latest build results. The red 'fail' icon is displayed if there is at least one failed build run for the commit.

Note that the legacy Stash notification type is deprecated – it is still available in Bamboo 5.6 but will be removed in Bamboo 5.7.

Configuration

There are just a few simple configuration steps to get the integrations described above with Bamboo (versions 5.6 and later) and Stash (versions 3.1 and later):

1. Create an Application Link

You only need to do this once for each pair of Stash and Bamboo instances.

See [Linking to another application](#).

Once linked, all the Stash repositories are available to your plans in Bamboo.

2. Choose the Stash repository for the Bamboo plan

Create a build plan (if necessary) and specify the repository in the plan (or job) configuration.

See [Stash](#) for more information about using Stash source repositories in Bamboo.

3. Build!

You can also use the Stash Rest API to automatically publish build status from Bamboo, Jenkins or any other build tool to Stash. See the Stash developer documentation to do with [updating build status](#).

Administering Stash

Administration actions that can be performed from the Stash Administration user interface (click the 'cog' icon in the Stash header):

- [Supported platforms](#)
- [Users and groups](#)
- [External user directories](#)
 - Connecting Stash to an existing LDAP directory
 - Connecting Stash to JIRA for user management
 - Delegating Stash authentication to an LDAP directory
 - Connecting Stash to Crowd
- [Global permissions](#)
- [Setting up your mail server](#)
- [Linking Stash with JIRA](#)
- [Connecting Stash to an external database](#)
- [Migrating Stash to another server](#)
- [Specifying the base URL for Stash](#)
- [Configuring the application navigator](#)
- [Managing add-ons](#)
- [Audit logging in Stash](#)

System administration advanced actions that can be performed from outside of the Stash user interface:

- Running the Stash installer
- Starting and stopping Stash
- Install Stash from an archive file
- Running Stash as a Linux service
- Running Stash as a Windows service
- Scaling Stash
- High availability for Stash
- Stash config properties
- Proxying and securing Stash
- Enabling SSH access to Git repositories in Stash
- Changing the port that Stash listens on
- Moving Stash to a different context path
- Running Stash with a dedicated user
- Stash debug logging
- Data recovery and backups
- Lockout recovery process
- Using diff transcoding in Stash

Users and groups

Stash comes with an internal user directory already built-in that is enabled by default at installation. When you create the first administrator during the setup procedure, that administrator's username and other details are stored in the internal directory.

Stash Admins and Sys Admins can manage users and groups in Stash as described on this page. You can also set up Stash to [use external user directories](#).

Note that:

- Even after users have been added to the Stash user directory, they will not be able to log in to Stash until they have been given [global access permissions](#).
- Permissions can also be applied separately at the level of [projects](#), [repositories](#) and [branches](#).

On this page:

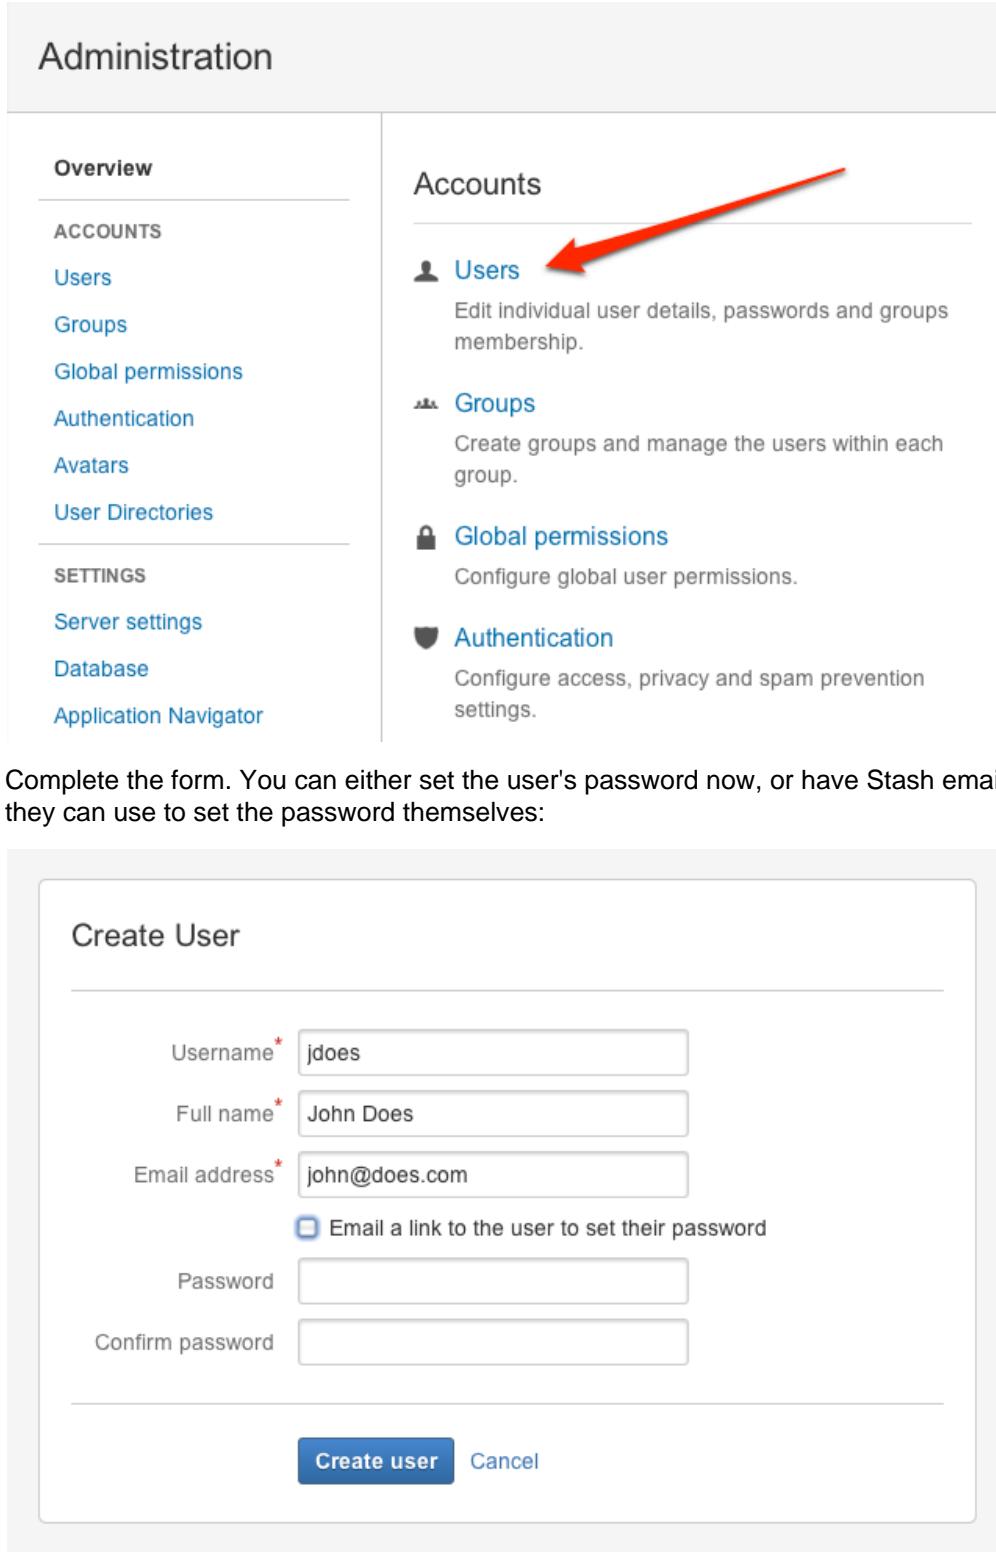

- [Creating a user](#)
- [Creating a group](#)
- [Adding users to groups](#)
 - From the user account page
 - From the group page
- [Changing usernames](#)
- [Deleting users and groups](#)

Related pages:

- [Getting started with Stash](#)
- [External user directories](#)

Creating a user

In the administration area, click **Users** (under 'Accounts') and then **Create user** (on the 'Users' screen)

The screenshot shows the Stash Administration interface. On the left, there's a sidebar with sections like Overview, ACCOUNTS (with links for Users, Groups, Global permissions, Authentication, Avatars, and User Directories), and SETTINGS (with links for Server settings, Database, and Application Navigator). On the right, under the Accounts section, there are links for Users, Groups, Global permissions, and Authentication. A red arrow points to the 'Users' link.

Create User

Username *

Full name *

Email address *

Email a link to the user to set their password

Password

Confirm password

Create user Cancel

Once you've created the user, click **Change permissions** to set up their access permissions. Note that a user doesn't have access to Stash until global access permissions have been set.

[← Back to Users](#)

John Does

jdoes

john@does.com

STASH USER [Change permissions](#)

Groups SSH keys

Groups

Name

Add groups [Add](#)

stash-users

See [Global permissions](#) for more information.

Creating a group

In the administration area, click **Groups** (under 'Accounts') and then **Create group**. Enter the name for the new group, and click **Create group** (again):

Create group

Group name *

Red team

[Create group](#) [Cancel](#)

Now you can add users to your new group (see the next section).

Adding users to groups

You can add users to groups in two ways:

- add a particular user to multiple groups, [from the user's account page](#) in the admin area.
- add multiple users to a particular group, [from the group's page](#).

From the user account page

To add a user to a group from the user's account page, click **Users** in the Administration section, and then use the filter to find the user:

Users

[Create user](#)

john

| Name | Username | Email | Directory |
|---------------|----------|------------------------|--------------------------|
| Bryce Johnson | bjohnson | bjohnson@atlassian.com | Extranet Crowd |
| John Does | jdoes | john@does.com | Stash Internal Directory |
| John Garcia | jgarcia | jgarcia@atlassian.com | Extranet Crowd |
| John Heintz | jheintz | jheintz@atlassian.com | Extranet Crowd |

On the account page for the user, use the filter to find a group to which you want to add the user:

[Groups](#)[SSH keys](#)

Groups

Name

atlas

[Add](#)

atlasdesk-team

atlaseye-users

atlassian-3rdparty-rw

atlassian-3rdparty-snapshot-rw

atlassian-accounting

atlassian-administration

Click **Add** for each group in turn.

From the group page

To add a user to a group from the group's page, click **Groups** (under "Accounts") in the administration area, and use the filter to find the group:

Groups

red team

Name

Red team

On the page for the group, use the filter to find a user whom you wish to add to the group:

[← Back to Groups](#)

Red team

[Delete Group](#)

adam

| | |
|--------------------|---------------------------|
| Adam Ahmed | aahmed@atlassian.com |
| Adam Ahmed (Admin) | aahmed@atlassian.com |
| Adam Barringer | abarringer@atlassian.com |
| Adam Duston | aduston@atlassian.com |
| Adam Jakubowski | ajakubowski@atlassian.com |
| Adam Laskowski | alaskowski@atlassian.com |

Add

Click **Add** for each user you select, to make them a member of the group.

Changing usernames

You can change the username for a user account that is hosted in Stash's internal user directory. Go to **Users** in the Administration section, and use the filter to find the user. On the account page for the user, click **Rename**.

Deleting users and groups

You can delete a user or group from Stash's internal user directory, or the external directory from which Stash sources users, such as an LDAP, Crowd or JIRA server.

When a user or group is deleted from such a directory, Stash checks to see if that user still exists in another directory:

- If the user or group *does* exist in another directory, Stash assumes the administrator intended to *migrate* the user or group between directories and we leave their data intact.
- If the user or group *does not* exist in another directory, Stash assumes the intent was to permanently delete them, and we delete the users permissions, SSH keys and 'rememberme' tokens.

Notes

- If an entire directory is deleted Stash *always* assumes it is a migration and does nothing to clean up after users and groups.
- Content which might be of historical interest (comments, pull requests, etc.) is not deleted when a user or group is. Only authentication, authorisation and data which serves no purpose to a user who can no longer log in is removed.
- In some situations, reordering the directories will change the directory that the current user comes from, if a user with the same username happens to exist in both. This behaviour can be used in some cases to create a copy of the existing configuration, move it to the top, then remove the old one. Note, however, that duplicate usernames are not a supported configuration.
- You can enable or disable a directory at any time. If you disable a directory, your configuration details will remain but Stash will not recognise the users and groups in that directory.

Limitations

- You cannot edit, disable or delete the directory that your own user account belongs to. This prevents administrators from locking themselves out of Stash, and applies to internal as well as external directories.
- You cannot remove the internal directory. This limitation aligns with the recommendation that you always keep an administrator or sysadmin account active in the Stash internal directory, so that you can troubleshoot problems with your user directories.

- You have to disable a directory before you can remove it. Removing a directory will remove the details from the database.

External user directories

You can connect Stash to external user directories. This allows you to use existing users and groups stored in an enterprise directory, and to manage those users and groups in one place.

User management functions include:

- **Authentication:** determining which user identity is sending a request to Stash.
- **Authorisation:** determining the access privileges for an authenticated user.
- **User management:** maintaining profile information in user's accounts.
- **Group membership:** storing and retrieving groups, and group membership.

It is important to understand that these are separate components of a user management system. You could use an external directory for any or all of the above tasks.

There are several approaches to consider when using external user directories with Stash, described briefly below:

- LDAP
- JIRA
- Crowd
- Multiple directories

Related pages:

- Connecting Stash to an existing LDAP directory
- Delegating Stash authentication to an LDAP directory
- Connecting Stash to Crowd
- Connecting Stash to JIRA for user management
- Users and groups
- External directory lockout recovery

- Connecting Atlassian Stash to your external directory is not sufficient to allow your users to log in to Stash. You must explicitly grant them access to Stash in the [global permission screen](#).
- We recommend that you use groups instead of individual accounts when granting permissions. However, be careful not to add more users to those groups than your Stash license allows. If the license limit is exceeded, your developers will not be able to push commits to repositories, and Stash will display a warning banner. See [this FAQ](#).
- Stash comes with an internal user directory, already built-in, that is enabled by default at installation. When you create the first administrator during the setup procedure, that administrator's username and other details are stored in the internal directory.
- See also this [information about deleting users and groups](#) in Stash.

LDAP

You should consider connecting to an LDAP directory server if your users and groups are stored in an enterprise directory.

There are two common ways of using an external LDAP directory with Stash:

- For full user and group management, including for user authentication — see [Connecting Stash to an existing LDAP directory](#) for instructions.
- For delegated user authentication only, while using Stash's internal directory for user and group management — see [Delegating Stash authentication to an LDAP directory](#) for instructions.

Stash is able to connect to the following LDAP directory servers:

- Microsoft Active Directory
- Apache Directory Server (ApacheDS) 1.0.x and 1.5.x

- Apple Open Directory (Read-Only)
- Fedora Directory Server (Read-Only Posix Schema)
- Novell eDirectory Server
- OpenDS
- OpenLDAP
- OpenLDAP (Read-Only Posix Schema)
- Generic Posix/RFC2307 Directory (Read-Only)
- Sun Directory Server Enterprise Edition (DSEE)
- Any generic LDAP directory server

JIRA

You can delegate Stash user and group management, as well as user authentication, to an [Atlassian JIRA](#) instance. This is a good option if you already use JIRA in your organization. Note that Stash can only connect to a JIRA server running JIRA 4.3 or later.

You should consider using [Atlassian Crowd](#) for more complex configurations with a large number of users.

See [Connecting Stash to JIRA for user management](#) for configuration instructions.

Crowd

You can connect Stash to [Atlassian Crowd](#) for user and group management, as well as for user authentication.

Crowd is an application security framework that handles authentication and authorisation for your web-based applications. With Crowd you can integrate multiple web applications with multiple user directories, with support for single sign-on (SSO) and centralised identity management. See the [Crowd Administration Guide](#).

You should consider connecting to Crowd if you want to use Crowd to manage existing users and groups in multiple directory types, or if you have users of other web-based applications.

See [Connecting Stash to Crowd](#) for configuration instructions.

Multiple directories

When Stash is connected directly to multiple user directories, where duplicate user names and group names are used across those directories, the effective group memberships that Stash uses for authorisation can be determined using either of these two schemes:

- 'aggregating membership'
- 'non-aggregating membership'.

See [Effective memberships with multiple directories](#) for more information about these two schemes.

Note that:

- Aggregating membership is used by default for new installations of Stash.
- Authentication, for when Stash is connected to multiple directories, only depends on the mapped groups in those directories – the aggregation scheme is not involved at all.
- For inactive users, Stash only checks if the user is active in the first (highest priority) directory in which they are found for the purpose of determining authentication. Whether a user is active or inactive does not affect how their memberships are determined.
- When a user is added to a group, they are only added to the first writeable directory available, in priority order.
- When a user is removed from a group, they are only removed from the group in the first directory the user appears in, when non-aggregating membership is used. With aggregating membership, they are removed from the group in *all* directories the user exists in.

A Stash admin can change the membership scheme used by Stash using the following commands:

- To change to *aggregating membership*, substitute your own values for <username>, <password> and <base-url> in this command:

```
curl -H 'Content-type: application/json' -X PUT -d
'{"membershipAggregationEnabled":true}' -u <username>:<password>
<base-url>/rest/crowd/latest/application
```

- To change to non-aggregating *membership*, substitute your own values for <username>, <password> and <base-url> in this command:

```
curl -H 'Content-type: application/json' -X PUT -d
'{"membershipAggregationEnabled":false}' -u <username>:<password>
<base-url>/rest/crowd/latest/application
```

Note that these operations are different from how you make these changes in Crowd. Note also that changing the aggregation scheme can affect the authorisation permissions for your Stash users, and how directory update operations are performed.

Connecting Stash to an existing LDAP directory

You can connect Stash to an existing LDAP user directory, so that your existing users and groups in an enterprise directory can be used in Stash. The LDAP directory is used for both user authentication and account management.

Stash is able to connect to the following LDAP directory servers:

- Microsoft Active Directory
- Apache Directory Server (ApacheDS) 1.0.x and 1.5.x
- Apple Open Directory (Read-Only)
- Fedora Directory Server (Read-Only Posix Schema)
- Novell eDirectory Server
- OpenDS
- OpenLDAP
- OpenLDAP (Read-Only Posix Schema)
- Generic Posix/RFC2307 Directory (Read-Only)
- Sun Directory Server Enterprise Edition (DSEE)
- Any generic LDAP directory server

See also this [information about deleting users and groups](#) in Stash.

On this page:

- License considerations
- Synchronisation when Stash is first connected to the LDAP directory
- Authentication when a user attempts to log in
- Connecting Stash
- Server settings
- LDAP schema
- LDAP permission
- Advanced settings
- User schema settings
- Group schema settings
- Membership schema settings

Connecting Atlassian Stash to your external directory is not sufficient to allow your users to log in to Stash. You must explicitly grant them access to Stash in the [global permission screen](#).

We recommend that you use groups instead of individual accounts when granting permissions.

License considerations

When connecting Stash to an external directory, be careful not to allow access to Stash by more users than your Stash license allows. If the license limit is exceeded, your developers will not be able to push commits to repositories, and Stash will display a warning banner. See [this FAQ](#).

Synchronisation when Stash is first connected to the LDAP directory

When you first connect Stash to an existing LDAP directory, the Stash internal directory is synchronised with the LDAP directory. User information, including groups and group memberships, is copied across to the Stash directory.

When we performed internal testing of synchronisation with an Active Directory server on our local network with 10 000 users, 1000 groups and 200 000 memberships, we found that the initial synchronisation took about 5 minutes. Subsequent synchronisations with 100 modifications on the AD server took a couple of seconds to complete. See the [option](#) below.

Note that when Stash is connected to an LDAP directory, you cannot update user details in Stash. Updates must be done directly on the LDAP directory, perhaps using a LDAP browser tool such as [Apache Directory Studio](#).

Option - Use LDAP filters to restrict the number of users and groups that are synchronised

You can use LDAP filters to restrict the users and groups that are synchronised with the Stash internal directory. You may wish to do this in order to limit the users or groups that can access Stash, or if you are concerned that synchronisation performance may be poor.

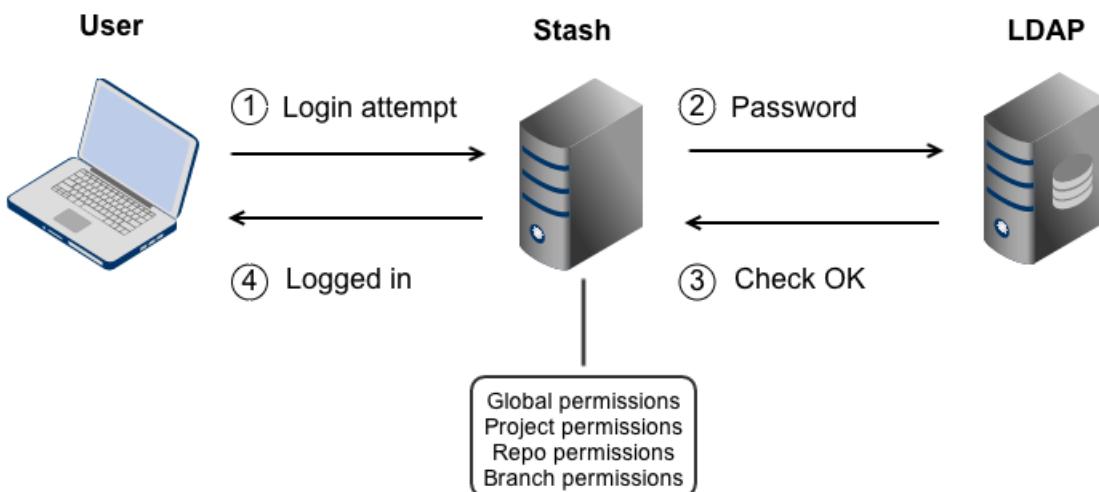

For example, to limit synchronisation to just the groups named "stash_user" or "red_team", enter the following into the **Group Object Filter** field (see [Group Schema Settings](#) below):

```
(&(objectClass=group) ( | (cn=stash_user) (cn:red_team) ))
```

For further discussion about filters, with examples, please see [How to Write LDAP Search Filters](#). Note that you need to know the names for the various containers, attributes and object classes in your particular directory tree, rather than simply copying these examples. You can discover these container names by using a tool such as [Apache Directory Studio](#).

Authentication when a user attempts to log in

When a user attempts to log in to Stash, once synchronisation has completed, Stash confirms that the user exists in its internal directory and then passes the user's password to the LDAP directory for confirmation. If the password matches that stored for the user, LDAP passes a confirmation back to Stash, and Stash logs in the user. During the user's session, all authorisations (i.e. access to Stash resources such as repositories, pull requests and administration screens) are handled by Stash, based on permissions maintained by Stash in its internal directory.

Connecting Stash

To connect Stash to an LDAP directory:

1. Log in as a user with 'Admin' permission.
2. In the Stash administration area, click **User Directories** (under 'Accounts').
3. Click **Add Directory** and select either **Microsoft Active Directory** or **LDAP** as the directory type.
4. Configure the directory settings, as described in the tables below.
5. Save the directory settings.
6. Define the directory order by clicking the arrows next to each directory on the 'User Directories' screen.
The directory order has the following effects:
 - The order of the directories is the order in which they will be searched for users and groups.
 - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

Server settings

| Setting | Description |
|----------------|---|
| Name | <p>Enter a meaningful name to help you identify the LDAP directory server. Examples:</p> <ul style="list-style-type: none"> • Example Company Staff Directory • Example Company Corporate LDAP |
| Directory Type | <p>Select the type of LDAP directory that you will connect to. If you are adding a new LDAP connection, the value you select here will determine the default values for many of the options on the rest of screen. Examples:</p> <ul style="list-style-type: none"> • Microsoft Active Directory • OpenDS • And more. |
| Hostname | <p>The host name of your directory server. Examples:</p> <ul style="list-style-type: none"> • ad.example.com • ldap.example.com • opensds.example.com |
| Port | <p>The port on which your directory server is listening. Examples:</p> <ul style="list-style-type: none"> • 389 • 10389 • 636 (for example, for SSL) |
| Use SSL | <p>Check this if the connection to the directory server is an SSL (Secure Sockets Layer) connection. Note that you will need to configure an SSL certificate in order to use this setting.</p> |
| Username | <p>The distinguished name of the user that the application will use when connecting to the directory server. Examples:</p> <ul style="list-style-type: none"> • cn=administrator,cn=users,dc=ad,dc=example,dc=com • cn=user,dc=domain,dc=name • user@domain.name <p>i Ensure that this is an administrator user for the LDAP engine. For example, in Active Directory the user will need to be a member of the built-in Administrators group.</p> |
| Password | <p>The password of the user specified above.</p> <p>Note: Connecting to an LDAP server requires that this application log in to the server with the username and password configured here. As a result, this password cannot be one-way hashed - it must be recoverable in the context of this application. The password is currently stored in the database in plain text without obfuscation. To guarantee its security, you need to ensure that other processes do not have OS-level read permissions for this application's database or configuration files.</p> |

LDAP schema

| Setting | Description |
|---------------------|---|
| Base DN | <p>The root distinguished name (DN) to use when running queries against the directory server.</p> <p>Examples:</p> <ul style="list-style-type: none"> • o=example,c=com • cn=users,dc=ad,dc=example,dc=com • For Microsoft Active Directory, specify the base DN in the following format: dc=domain1,dc=local. You will need to replace the domain1 and local for your specific configuration. <p>Microsoft Server provides a tool called ldp.exe which is useful for finding out and configuring the the LDAP structure of your server.</p> |
| Additional User DN | <p>This value is used in addition to the base DN when searching and loading users. If no value is supplied, the subtree search will start from the base DN. Example:</p> <ul style="list-style-type: none"> • ou=Users |
| Additional Group DN | <p>This value is used in addition to the base DN when searching and loading groups. If no value is supplied, the subtree search will start from the base DN. Example:</p> <ul style="list-style-type: none"> • ou=Groups |

LDAP permission

| Setting | Description |
|------------------------------|---|
| Read Only | LDAP users, groups and memberships are retrieved from your directory server and can only be modified via your directory server. You cannot modify LDAP users, groups or memberships via the application administration screens. |
| Read Only, with Local Groups | LDAP users, groups and memberships are retrieved from your directory server and can only be modified via your directory server. You cannot modify LDAP users, groups or memberships via the application administration screens. However, you can add groups to the internal directory and add LDAP users to those groups. |

Advanced settings

| Setting | Description |
|----------------------------|--|
| Enable Nested Groups | Enable or disable support for nested groups. Some directory servers allow you to define a group as a member of another group. Groups in such a structure are called 'nested groups'. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups. |
| Manage User Status Locally | If true, you can activate and deactivate users in Crowd independent of their status in the directory server. |
| Use Paged Results | Enable or disable the use of the LDAP control extension for simple paging of search results. If paging is enabled, the search will retrieve sets of data rather than all of the search results at once. Enter the desired page size – that is, the maximum number of search results to be returned per page when paged results are enabled. The default is 1000 results. |
| Follow Referrals | Choose whether to allow the directory server to redirect requests to other servers. This option uses the node referral (JNDI lookup java.naming.referral) configuration setting. It is generally needed for Active Directory servers configured without proper DNS, to prevent a 'javax.naming.PartialResultException: Unprocessed Continuation Reference(s)' error. |

| | |
|------------------------------------|--|
| Naive DN Matching | <p>If your directory server will always return a consistent string representation of a DN, you can enable naive DN matching. Using naive DN matching will result in a significant performance improvement, so we recommend enabling it where possible.</p> <p>This setting determines how your application will compare DNs to determine if they are equal.</p> <ul style="list-style-type: none"> • If this checkbox is selected, the application will do a direct, case-insensitive, string comparison. This is the default and recommended setting for Active Directory, because Active Directory guarantees the format of DNs. • If this checkbox is not selected, the application will parse the DN and then check the parsed version. |
| Enable Incremental Synchronisation | <p>Enable incremental synchronisation if you only want changes since the last synchronisation to be queried when synchronising a directory.</p> <p>⚠️ Please be aware that when using this option, the user account configured for synchronisation must have read access to:</p> <ul style="list-style-type: none"> • The <code>uSNChanged</code> attribute of all users and groups in the directory that need to be synchronised. • The objects and attributes in the Active Directory deleted objects container (see Microsoft's Knowledge Base Article No. 892806 for details). <p>If at least one of these conditions is not met, you may end up with users who are added to (or deleted from) the Active Directory not being respectively added (or deleted) in the application.</p> <p>This setting is only available if the directory type is set to "Microsoft Active Directory".</p> |
| Synchronisation Interval (minutes) | <p>Synchronisation is the process by which the application updates its internal store of user data to agree with the data on the directory server. The application will send a request to your directory server every x minutes, where 'x' is the number specified here. The default value is 60 minutes.</p> |
| Read Timeout (seconds) | <p>The time, in seconds, to wait for a response to be received. If there is no response within the specified time period, the read attempt will be aborted. A value of 0 (zero) means there is no limit. The default value is 120 seconds.</p> |
| Search Timeout (seconds) | <p>The time, in seconds, to wait for a response from a search operation. A value of 0 (zero) means there is no limit. The default value is 60 seconds.</p> |
| Connection Timeout (seconds) | <p>This setting affects two actions. The default value is 0.</p> <ul style="list-style-type: none"> • The time to wait when getting a connection from the connection pool. A value of 0 (zero) means there is no limit, so wait indefinitely. • The time, in seconds, to wait when opening new server connections. A value of 0 (zero) means that the TCP network timeout will be used, which may be several minutes. |

User schema settings

| Setting | Description |
|--------------------|---|
| User Object Class | <p>This is the name of the class used for the LDAP user object. Example:</p> <ul style="list-style-type: none"> • <code>user</code> |
| User Object Filter | <p>The filter to use when searching user objects. Example:</p> <ul style="list-style-type: none"> • <code>(&(objectCategory=Person)(sAMAccountName=*))</code> <p>More examples can be found here and here.</p> |

| | |
|-----------------------------|--|
| User Name Attribute | <p>The attribute field to use when loading the username. Examples:</p> <ul style="list-style-type: none"> • cn • sAMAccountName <p>NB: In Active Directory, the 'sAMAccountName' is the 'User Logon Name (pre-Windows 2000)' field. The User Logon Name field is referenced by 'cn'.</p> |
| User Name RDN Attribute | <p>The RDN (relative distinguished name) to use when loading the username. The DN for each LDAP entry is composed of two parts: the RDN and the location within the LDAP directory where the record resides. The RDN is the portion of your DN that is not related to the directory tree structure. Example:</p> <ul style="list-style-type: none"> • cn |
| User First Name Attribute | <p>The attribute field to use when loading the user's first name. Example:</p> <ul style="list-style-type: none"> • givenName |
| User Last Name Attribute | <p>The attribute field to use when loading the user's last name. Example:</p> <ul style="list-style-type: none"> • sn |
| User Display Name Attribute | <p>The attribute field to use when loading the user's full name. Example:</p> <ul style="list-style-type: none"> • displayName |
| User Email Attribute | <p>The attribute field to use when loading the user's email address. Example:</p> <ul style="list-style-type: none"> • mail |
| User Password Attribute | <p>The attribute field to use when loading a user's password. Example:</p> <ul style="list-style-type: none"> • unicodePwd |
| User Unique ID Attribute | <p>The attribute used as a unique immutable identifier for user objects. This is used to track username changes and is optional. If this attribute is not set (or is set to an invalid value), user renames will not be detected — they will be interpreted as a user deletion then a new user addition.</p> <p>This should normally point to a UUID value. Standards-compliant LDAP servers will implement this as 'entryUUID' according to RFC 4530. This setting exists because it is known under different names on some servers, e.g. 'objectGUID' in Microsoft Active Directory.</p> |

Group schema settings

| Setting | Description |
|---------------------|--|
| Group Object Class | <p>This is the name of the class used for the LDAP group object. Examples:</p> <ul style="list-style-type: none"> • groupOfUniqueNames • group |
| Group Object Filter | <p>The filter to use when searching group objects. Example:</p> <ul style="list-style-type: none"> • (&(objectClass=group)(cn=*)) |

| | |
|-----------------------------|---|
| Group Name Attribute | The attribute field to use when loading the group's name. Example: <ul style="list-style-type: none">• cn |
| Group Description Attribute | The attribute field to use when loading the group's description. Example: <ul style="list-style-type: none">• description |

Membership schema settings

| Setting | Description |
|---|--|
| Group Members Attribute | The attribute field to use when loading the group's members. Example: <ul style="list-style-type: none">• member |
| User Membership Attribute | The attribute field to use when loading the user's groups. Example: <ul style="list-style-type: none">• memberOf |
| Use the User Membership Attribute, when finding the user's group membership | <p>Check this if your directory server supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.)</p> <ul style="list-style-type: none"> If this checkbox is selected, your application will use the group membership attribute on the user when retrieving the list of groups to which a given user belongs. This will result in a more efficient retrieval. If this checkbox is not selected, your application will use the members attribute on the group ('member' by default) for the search. If the Enable Nested Groups checkbox is selected, your application will ignore the Use the User Membership Attribute option and will use the members attribute on the group for the search. |
| Use the User Membership Attribute, when finding the members of a group | <p>Check this if your directory server supports the user membership attribute on the group. (By default, this is the 'member' attribute.)</p> <ul style="list-style-type: none"> If this checkbox is selected, your application will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient search. If this checkbox is not selected, your application will use the members attribute on the group ('member' by default) for the search. |

Connecting Stash to JIRA for user management

 *This page does not apply to JIRA Cloud; you can't use JIRA Cloud to manage your Stash users.*

You can connect Stash to an existing Atlassian JIRA instance to delegate Stash user and group management, and authentication. Stash provides a "read-only" connection to JIRA for user management. This means that users and groups, fetched from JIRA, can only be modified or updated in that JIRA server, rather than in Stash.

Choose this option, as an alternative to Atlassian Crowd, for simple configurations with a limited number of users. Note that Stash can only connect to a JIRA server running JIRA 4.3 or later.

Connecting Stash and JIRA is a 3-step process:

1. Set up JIRA to allow connections from Stash
2. Set up Stash to connect to JIRA
3. Set up Stash users and groups in JIRA

Also on this page:

- [Server settings](#)
- [JIRA server permissions](#)
- [Advanced settings](#)

 You need to be an administrator in JIRA and a system administrator in Stash to perform the following tasks.

1. Set up JIRA to allow connections from Stash

1. Log in as a user with the 'JIRA Administrators' global permission.
2. For JIRA 4.3.x, select **Other Application** from the 'Users, Groups & Roles' section of the 'Administration' menu.
For JIRA 4.4 or later, choose **Administration > Users > JIRA User Server**.
3. Click **Add Application**.
4. Enter the **application name** (case-sensitive) and **password** that Stash will use when accessing JIRA.
5. Enter the **IP address** of your Stash server. Valid values are:
 - A full IP address, e.g. 192.168.10.12.
 - A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to [CIDR notation on Wikipedia](#) and [RFC 4632](#).
6. Click **Save**.
7. Define the directory order, on the 'User Directories' screen, by clicking the blue up- and down-arrows next to each directory. The directory order has the following effects:
 - The order of the directories is the order in which they will be searched for users and groups.
 - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

2. Set up Stash to connect to JIRA

1. Log in to Stash as a user with 'Admin' permission.
2. In the Stash administration area click **User Directories** (under 'Accounts').
3. Click **Add Directory** and select **Atlassian JIRA**.
4. Enter settings, as described below.
5. Test and save the directory settings.
6. Define the directory order, on the 'User Directories' screen, by clicking the arrows for each directory. The directory order has the following effects:
 - The order of the directories is the order in which they will be searched for users and groups.
 - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

3. Set up Stash users and groups in JIRA

In order to use Stash, users must be a member of the `stash-users` group or have Stash global permissions. Follow these steps to configure your Stash groups in JIRA:

1. Add the `stash-users` and `stash-administrators` groups in JIRA.
2. Add your own username as a member of both of the above groups.
3. Choose one of the following methods to give your existing JIRA users access to Stash:
 - Option 1: In JIRA, find the groups that the relevant users belong to. Add those groups as members of one or both of the above Stash groups.
 - Option 2: Log in to Stash using your JIRA account and go to the administration area. Click **Global permissions** (under 'Accounts'). Assign the appropriate permissions to the relevant JIRA groups. See [Global permissions](#).

 Connecting Atlassian Stash to JIRA for user management is not sufficient, by itself, to allow your users to log in to Stash. You must also grant them access to Stash by using one of the above 2 options.

We recommend that you use groups instead of individual accounts when granting permissions. However, be careful not to add more users to those groups than your Stash license allows. If the license limit is exceeded, your developers will not be able to push commits to repositories, and Stash will display a warning banner. See this [FAQ](#).

See also this [information about deleting users and groups](#) in Stash.

Server settings

| Setting | Description |
|----------------------|--|
| Name | A meaningful name that will help you to identify this JIRA server amongst your list of directory servers. Examples: <ul style="list-style-type: none"> • JIRA Server • My Company JIRA |
| Server URL | The web address of your JIRA server. Examples: <ul style="list-style-type: none"> • <code>http://www.example.com:8080</code> • <code>http://jira.example.com</code> |
| Application Name | The name used by your application when accessing the JIRA server that acts as user manager. Note that you will also need to define your application to that JIRA server, via the ' Other Applications ' option in the 'Users, Groups & Roles' section of the 'Administration' menu. |
| Application Password | The password used by your application when accessing the JIRA server that acts as user manager. |

JIRA server permissions

| Setting | Description |
|-----------|--|
| Read Only | The users, groups and memberships in this directory are retrieved from the JIRA server that is acting as user manager. They can only be modified via that JIRA server. |

Advanced settings

| Setting | Description |
|------------------------------------|--|
| Enable Nested Groups | Enable or disable support for nested groups. Before enabling nested groups, please check to see if nested groups are enabled on the JIRA server that is acting as user manager. When nested groups are enabled, you can define a group as a member of another group. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups. |
| Enable Incremental Synchronisation | Enable or disable incremental synchronisation. Only changes since the last synchronisation will be retrieved when synchronising a directory.. |
| Synchronisation Interval (minutes) | Synchronisation is the process by which the application updates its internal store of user data to agree with the data on the directory server. The application will send a request to your directory server every x minutes, where 'x' is the number specified here. The default value is 60 minutes. |

DRAFT - Connecting Stash to JIRA for user management

 This page does not apply to JIRA Cloud; you can't use JIRA Cloud to manage your Stash users.

You can connect Stash to an existing Atlassian JIRA instance to delegate Stash user and group management, and authentication. Stash provides a "read-only" connection to JIRA for user management. This means that users and groups, fetched from JIRA, can only be modified or updated in that JIRA server, rather than in Stash.

Choose this option, as an alternative to Atlassian Crowd, for simple configurations with a limited number of users. Note that Stash can only connect to a JIRA server running JIRA 4.3 or later.

Connecting Stash and JIRA is a 3-step process:

1. Set up JIRA to allow connections from Stash
2. Set up Stash to connect to JIRA

3. Set up Stash users and groups in JIRA
4. Assign the right permissions to groups and users in Stash

Also on this page:

- [Server settings](#)
- [JIRA server permissions](#)
- [Advanced settings](#)

 You need to be an administrator in JIRA and a system administrator in Stash to perform the following tasks.

1. Set up JIRA to allow connections from Stash

1. Log in as a user with the 'JIRA Administrators' global permission.
2. For JIRA 4.3.x, select **Other Application** from the 'Users, Groups & Roles' section of the 'Administration' menu.
For JIRA 4.4 or later, choose **Administration > Users > JIRA User Server**.
3. Click **Add Application**.
4. Enter the **application name** (case-sensitive) and **password** that Stash will use when accessing JIRA.
5. Enter the **IP address** of your Stash server. Valid values are:
 - A full IP address, e.g. 192.168.10.12.
 - A wildcard IP range, using CIDR notation, e.g. 192.168.10.1/16. For more information, see the introduction to [CIDR notation on Wikipedia](#) and [RFC 4632](#).
6. Click **Save**.
7. Define the directory order, on the 'User Directories' screen, by clicking the blue up- and down-arrows next to each directory. The directory order has the following effects:
 - The order of the directories is the order in which they will be searched for users and groups.
 - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

2. Set up Stash to connect to JIRA

1. Log in to Stash as a user with 'Admin' permission.
2. In the Stash administration area click **User Directories** (under 'Accounts').
3. Click **Add Directory** and select **Atlassian JIRA**.
4. Enter settings, as described below.
5. Test and save the directory settings.
6. Define the directory order, on the 'User Directories' screen, by clicking the arrows for each directory. The directory order has the following effects:
 - The order of the directories is the order in which they will be searched for users and groups.
 - Therefore, it is a good practice to keep the Stash Internal database on the top with your admin user (meaning the [Global permissions](#) assigned to it is 'System Administrator') just in case you lose the connection to your external directory and still need to manage your instance. **You will need to be able to login with a 'System Administrator' user in order to configure the groups on Step #4.** To exemplify: if you have an admin user created in your Stash Internal directory and also in your JIRA and if JIRA is the first one on your list, the password will be checked against what is recorded on JIRA.
 - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

3. Set up Stash users and groups in JIRA

In order for users to be able to log in to Stash, they must have at least 'Stash User' [Global permission](#) assigned to them, either directly or through group membership. Follow these steps to configure your Stash groups in JIRA:

1. Login to your JIRA instance. Add new Stash groups to it. You can start by adding 4 groups to represent each one of Stash [Global permissions](#). Notice that the new Stash groups will need to be configured further with the right [Global permissions](#) in Stash once synchronised. You have the option to create a `stash-users` group in JIRA. This group is already created with 'Stash User' [Global permissions](#) in Stash.
2. Assign the JIRA users which you intend to give access to Stash to each one of the groups you created

above according to the [Global permissions](#) you expect them to have in Stash.

4. Assign the right permissions to groups and users in Stash

In order for users to be able to log in to Stash, they must have at least "Stash User" [Global permission](#) assigned to them, either directly or through group membership. Follow these steps to configure your Stash groups in JIRA:

1. Login to Stash as a 'System Administrator'. Click the cog icon and then **User Directories** and make sure you synchronise your instance to your JIRA.
2. Click the cog icon and then **Global permissions**. Assign the appropriate permissions to the relevant JIRA groups.
3. Once you synchronise your external directory with your Stash instance, **all users and groups** created in JIRA will be shown in Stash.
4. This is expected and it doesn't mean that all these users are being counted against your Stash license. As described on the [Global permissions](#) document, if the users present on your Stash user base have not been assigned "Stash User" [Global permissions](#) or higher, either directly or through group membership, these users are considered unlicensed and do not count towards your Stash license limit.

i We recommend that you use groups instead of individual accounts when granting permissions. However, be careful not to add more users to those groups that your Stash license allows. If the license limit is exceeded, your developers will not be able to push commits to repositories, and Stash will display a warning banner. See [this FAQ](#).

See also this [information about deleting users and groups](#) in Stash.

Server settings

| Setting | Description |
|----------------------|--|
| Name | A meaningful name that will help you to identify this JIRA server amongst your list of directory servers. Examples: <ul style="list-style-type: none"> • JIRA Server • My Company JIRA |
| Server URL | The web address of your JIRA server. Examples: <ul style="list-style-type: none"> • <code>http://www.example.com:8080</code> • <code>http://jira.example.com</code> |
| Application Name | The name used by your application when accessing the JIRA server that acts as user manager. Note that you will also need to define your application to that JIRA server, via the ' Other Applications ' option in the 'Users, Groups & Roles' section of the 'Administration' menu. |
| Application Password | The password used by your application when accessing the JIRA server that acts as user manager. |

JIRA server permissions

| Setting | Description |
|-----------|--|
| Read Only | The users, groups and memberships in this directory are retrieved from the JIRA server that is acting as user manager. They can only be modified via that JIRA server. |

Advanced settings

| Setting | Description |
|------------------------------------|--|
| Enable Nested Groups | Enable or disable support for nested groups. Before enabling nested groups, please check to see if nested groups are enabled on the JIRA server that is acting as user manager. When nested groups are enabled, you can define a group as a member of another group. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups. |
| Enable Incremental Synchronisation | Enable or disable incremental synchronisation. Only changes since the last synchronisation will be retrieved when synchronising a directory.. |
| Synchronisation Interval (minutes) | Synchronisation is the process by which the application updates its internal store of user data to agree with the data on the directory server. The application will send a request to your directory server every x minutes, where 'x' is the number specified here. The default value is 60 minutes. |

Delegating Stash authentication to an LDAP directory

You can configure Stash to use an LDAP directory for delegated user authentication while still using Stash for user and group management.

You can either create new user accounts manually in the LDAP directory, or use the option to automatically create a user account when the user attempts to log in, as described in the [Copy users on login](#) section below.

See also this [information about deleting users and groups](#) in Stash.

To connect Stash to an LDAP directory for delegated authentication:

1. Log in to Stash as a user with 'Admin' permission.
2. Go to the Stash administration area and click **User Directories** (under 'Accounts').
3. Click **Add Directory** and select **Internal with LDAP Authentication** as the directory type.
4. Configure the directory settings, as described in the tables below.
5. Save the directory settings.
6. Define the directory order by clicking the arrows for each directory on the 'User Directories' screen. The directory order has the following effects:
 - The order of the directories is the order in which they will be searched for users and groups.
 - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

 Connecting Atlassian Stash to your external directory is not sufficient to allow your users to log in to Stash. You must explicitly grant them access to Stash in the [global permission screen](#).

We recommend that you use groups instead of individual accounts when granting permissions. However, be careful not to add more users to those groups than your Stash license allows. If the license limit is exceeded, your developers will not be able to push commits to repositories, and Stash will display a warning banner. See [this FAQ](#).

On this page:

- [Server settings](#)
- [Manually creating users](#)
- [Copying users on login](#)
- [LDAP schema](#)
- [Advanced settings](#)
- [User schema settings](#)
- [Group schema settings](#)
- [Membership schema settings](#)

Server settings

| Setting | Description |
|----------------|---|
| Name | A descriptive name that will help you to identify the directory. Examples: <ul style="list-style-type: none"> Internal directory with LDAP Authentication Corporate LDAP for Authentication Only |
| Directory Type | Select the type of LDAP directory that you will connect to. If you are adding a new LDAP connection, the value you select here will determine the default values for some of the options on the rest of screen. Examples: <ul style="list-style-type: none"> Microsoft Active Directory OpenDS And more. |
| Hostname | The host name of your directory server. Examples: <ul style="list-style-type: none"> ad.example.com ldap.example.com opends.example.com |
| Port | The port on which your directory server is listening. Examples: <ul style="list-style-type: none"> 389 10389 636 (for example, for SSL) |
| Use SSL | Check this box if the connection to the directory server is an SSL (Secure Sockets Layer) connection. Note that you will need to configure an SSL certificate in order to use this setting. |
| Username | The distinguished name of the user that the application will use when connecting to the directory server. Examples: <ul style="list-style-type: none"> cn=administrator,cn=users,dc=ad,dc=example,dc=com cn=user,dc=domain,dc=name user@domain.name |
| Password | The password of the user specified above. |

Manually creating users

Move the delegated authentication directory to the top of the User Directories list and create the user manually (go to **Administration > Users > Create user**). Using this manual method you must currently create a temporary password when creating users. There is an improvement request to address this:

 **STASH-3424** - Disable "Change password" field from admin and user page when delegated authentication is used [OPEN](#)

 If you intend to *change* the authentication directory of your users from Stash Internal Directory to Delegated LDAP Authentication you must select the option to "Copy User on Login" since you can't create a new user that has the same username as another user in another directory.

Copying users on login

The settings described in the table below relate to when a user attempts to authenticate with Stash. This authentication attempt can occur either:

- when using the Stash login screen.
- when issuing a Git clone or push command at the command line, for a repository managed by Stash.

| Setting | Description |
|---------|-------------|
| | |

| | |
|--|--|
| <input type="checkbox"/> Copy User on Login | <p>This option affects what will happen when a user attempts to log in. If this box is checked, the user will be created automatically in the internal directory that is using LDAP for authentication when the user first logs in and their details will be synchronised on each subsequent log in. If this box is not checked, the user's login will fail if the user wasn't already manually created in the directory.</p> <p>If you check this box the following additional fields will appear on the screen, which are described in more detail below:</p> <ul style="list-style-type: none"> • Default Group Memberships • Synchronise Group Memberships • User Schema Settings (described in a separate section below) |
| <input type="checkbox"/> Default Group Memberships | <p>This field appears if you check the Copy User on Login box. If you would like users to be automatically added to a group or groups, enter the group name(s) here. To specify more than one group, separate the group names with commas. Each time a user logs in, their group memberships will be checked. If the user does not belong to the specified group(s), their username will be added to the group(s). If a group does not yet exist, it will be added to the internal directory that is using LDAP for authentication.</p> <p>Please note that there is no validation of the group names. If you mis-type the group name, authorisation failures will result – users will not be able to access the applications or functionality based on the intended group name.</p> <p>Examples:</p> <ul style="list-style-type: none"> • confluence-users • bamboo-users, jira-users, jira-developers |
| <input type="checkbox"/> Synchronise Group Memberships | <p>This field appears if you select the Copy User on Login checkbox. If this box is checked, group memberships specified on your LDAP server will be synchronised with the internal directory each time the user logs in.</p> <p>If you check this box the following additional fields will appear on the screen, both described in more detail below:</p> <ul style="list-style-type: none"> • Group Schema Settings (described in a separate section below) • Membership Schema Settings (described in a separate section below) |

LDAP schema

| Setting | Description |
|---------------------|---|
| Base DN | <p>The root distinguished name (DN) to use when running queries against the directory server.</p> <p>Examples:</p> <ul style="list-style-type: none"> • o=example, c=com • cn=users, dc=ad, dc=example, dc=com • For Microsoft Active Directory, specify the base DN in the following format: dc=domain1, dc=local. You will need to replace the domain1 and local for your specific configuration. Microsoft Server provides a tool called ldp.exe which is useful for finding out and configuring the the LDAP structure of your server. |
| User Name Attribute | <p>The attribute field to use when loading the username. Examples:</p> <ul style="list-style-type: none"> • cn • SAMAccountName |

Advanced settings

| Setting | Description |
|---------|-------------|
| | |

| | |
|----------------------|---|
| Enable Nested Groups | Enable or disable support for nested groups. Some directory servers allow you to define a group as a member of another group. Groups in such a structure are called 'nested groups'. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups. |
| Use Paged Results | Enable or disable the use of the LDAP control extension for simple paging of search results. If paging is enabled, the search will retrieve sets of data rather than all of the search results at once. Enter the desired page size – that is, the maximum number of search results to be returned per page when paged results are enabled. The default is 1000 results. |
| Follow Referrals | Choose whether to allow the directory server to redirect requests to other servers. This option uses the node referral (JNDI lookup <code>java.naming.referral</code>) configuration setting. It is generally needed for Active Directory servers configured without proper DNS, to prevent a ' <code>javax.naming.PartialResultException: Unprocessed Continuation Reference(s)</code> ' error. |

User schema settings

Note: this section is only visible when **Copy User on Login** is enabled.

| Setting | Description |
|-----------------------------|---|
| Additional User DN | This value is used in addition to the base DN when searching and loading users. If no value is supplied, the subtree search will start from the base DN. Example: <ul style="list-style-type: none"> • <code>ou=Users</code> |
| User Object Class | This is the name of the class used for the LDAP user object. Example: <ul style="list-style-type: none"> • <code>user</code> |
| User Object Filter | The filter to use when searching user objects. Example: <ul style="list-style-type: none"> • <code>(&(objectCategory=Person) (sAMAccountName=*))</code> |
| User Name RDN Attribute | The RDN (relative distinguished name) to use when loading the username. The DN for each LDAP entry is composed of two parts: the RDN and the location within the LDAP directory where the record resides. The RDN is the portion of your DN that is not related to the directory tree structure. Example: <ul style="list-style-type: none"> • <code>cn</code> |
| User First Name Attribute | The attribute field to use when loading the user's first name. Example: <ul style="list-style-type: none"> • <code>givenName</code> |
| User Last Name Attribute | The attribute field to use when loading the user's last name. Example: <ul style="list-style-type: none"> • <code>sn</code> |
| User Display Name Attribute | The attribute field to use when loading the user's full name. Example: <ul style="list-style-type: none"> • <code>displayName</code> |
| User Email Attribute | The attribute field to use when loading the user's email address. Example: <ul style="list-style-type: none"> • <code>mail</code> |

Group schema settings

Note: this section is only visible when both **Copy User on Login** and **Synchronise Group Memberships** are enabled.

| Setting | Description |
|-----------------------------|--|
| Additional Group DN | This value is used in addition to the base DN when searching and loading groups. If no value is supplied, the subtree search will start from the base DN. Example: <ul style="list-style-type: none">• ou=Groups |
| Group Object Class | This is the name of the class used for the LDAP group object. Examples: <ul style="list-style-type: none">• groupOfUniqueNames• group |
| Group Object Filter | The filter to use when searching group objects. Example: <ul style="list-style-type: none">• (objectCategory=Group) |
| Group Name Attribute | The attribute field to use when loading the group's name. Example: <ul style="list-style-type: none">• cn |
| Group Description Attribute | The attribute field to use when loading the group's description. Example: <ul style="list-style-type: none">• description |

Membership schema settings

Note: this section is only visible when both **Copy User on Login** and **Synchronise Group Memberships** are enabled.

| Setting | Description |
|---|---|
| Group Members Attribute | The attribute field to use when loading the group's members. Example: <ul style="list-style-type: none">• member |
| User Membership Attribute | The attribute field to use when loading the user's groups. Example: <ul style="list-style-type: none">• memberOf |
| Use the User Membership Attribute, when finding the user's group membership | Check this box if your directory server supports the group membership attribute on the user. (By default, this is the 'memberOf' attribute.) <ul style="list-style-type: none">• If this box is checked, your application will use the group membership attribute on the user when retrieving the members of a given group. This will result in a more efficient retrieval.• If this box is not checked, your application will use the members attribute on the group ('member' by default) for the search. |

Connecting Stash to Crowd

You can configure Stash to use Atlassian Crowd for user and group management, and for authentication and authorisation.

Atlassian Crowd is an application security framework that handles authentication and authorisation for your web-based applications. With Crowd you can integrate multiple web applications and user directories, with support for single sign-on (SSO) and centralised identity management. See the [Crowd Administration Guide](#).

Connect to Crowd if you want to use Crowd to manage existing users and groups in multiple directory types, or if you have users of other web-based applications.

See also this [information about deleting users and groups in Stash](#).

Connecting Atlassian Stash to your external directory is not sufficient to allow your users to log in to Stash. You must explicitly grant them access to Stash in the [global permission screen](#).

We recommend that you use groups instead of individual accounts when granting permissions. However

, be careful not to add more users to those groups that your Stash license allows. If the license limit is exceeded, your developers will not be able to push commits to repositories, and Stash will display a warning banner. See this [FAQ](#).

On this page:

- Server settings
- Crowd permissions
- Advanced settings
- Single sign-on (SSO) with Crowd
- Using multiple directories

To connect Stash to Crowd:

1. Log in as a user with 'Admin' permission.
2. In the Stash administration area, click **User Directories** (under 'Accounts').
3. Click **Add Directory** and select **Atlassian Crowd**.
4. Enter settings, as described below.
5. Test and save the directory settings.
6. Define the directory order, on the **Directories** tab, by clicking the blue up- and down-arrows next to each directory. The directory order has the following effects:
 - The order of the directories is the order in which they will be searched for users and groups.
 - Changes to users and groups will be made only in the first directory where the application has permission to make changes.

Server settings

| Setting | Description |
|----------------------|--|
| Name | A meaningful name that will help you to identify this Crowd server amongst your list of directory servers. Examples: <ul style="list-style-type: none"> • Crowd Server • Example Company Crowd |
| Server URL | The web address of your Crowd console server. Examples: <ul style="list-style-type: none"> • <code>http://www.example.com:8095/crowd/</code> • <code>http://crowd.example.com</code> |
| Application Name | The name of your application, as recognised by your Crowd server. Note that you will need to define the application in Crowd too, using the Crowd administration Console. See the Crowd documentation on adding an application . |
| Application Password | The password which the application will use when it authenticates against the Crowd framework as a client. This must be the same as the password you have registered in Crowd for this application. See the Crowd documentation on adding an application . |

Crowd permissions

Stash offers **Read Only** permissions for Crowd directories. The users, groups and memberships in Crowd directories are retrieved from Crowd and can only be modified from Crowd. You cannot modify Crowd users, groups or memberships using the Stash administration screens.

For local Stash directories, **Read Only** and **Read/Write** permissions are available.

Advanced settings

| Setting | Description |
|---------|-------------|
| | |

| | |
|------------------------------------|---|
| Enable Nested Groups | Enable or disable support for nested groups. Before enabling nested groups, please check to see if the user directory or directories in Crowd support nested groups. When nested groups are enabled, you can define a group as a member of another group. If you are using groups to manage permissions, you can create nested groups to allow inheritance of permissions from one group to its sub-groups. |
| Synchronisation Interval (minutes) | Synchronisation is the process by which the application updates its internal store of user data to agree with the data on the directory server. The application will send a request to your directory server every x minutes, where 'x' is the number specified here. The default value is 60 minutes. |

Single sign-on (SSO) with Crowd

Once the Crowd directory has been set up, you can enable Crowd SSO integration by adding the following setting to `<STASH_HOME>/shared/stash-config.properties` (create this file if it doesn't exist yet):

stash-config.properties

```
# Whether SSO support should be enabled or not. Regardless of this setting SSO authentication
# will only be activated when a Crowd directory is configured in Stash that is configured
# for SSO.
plugin.auth-crowd.sso.enabled=true
```

Please note that you will need to correctly set up the domains of the applications involved in SSO. See [Crowd SSO Domain examples](#).

In addition to this property, Crowd SSO integration can be tuned using the system properties described on [Stash config properties](#).

Using multiple directories

When Stash is connected to Crowd you can map Stash to multiple user directories in Crowd.

For Crowd 2.8, and later versions, there are two different membership schemes that Crowd can use when multiple directories are mapped to an integrated application, and duplicate user names and group names are used across those directories. The schemes are called 'aggregating membership' and 'non-aggregating membership' and are used to determine the effective group memberships that Stash uses for *authorisation*. See [Effective memberships with multiple directories](#) for more information about these two schemes in Crowd.

Note that:

- *Authentication*, for when Stash is mapped to multiple directories in Crowd, only depends on the mapped groups in those directories – the aggregation scheme is not involved at all.
- For inactive users, Stash only checks if the user is active in the first (highest priority) directory in which they are found to determine *authentication*. The membership schemes described above are not used when Crowd determines if a user should have access to Stash.
- When a user is added to a group, they are only added to the first writeable directory available, in priority order.
- When a user is removed from a group, they are only removed from the group in the first directory the user appears in, when non-aggregating membership is used. With aggregating membership, they are removed from the group in *all* directories the user exists in.

An administrator can set the aggregation scheme that Stash uses when integrated with Crowd. Go to the **Directories** tab for the Stash instance in Crowd, and check **Aggregate group memberships across directories** to use the 'aggregating membership' scheme. When the checkbox is clear 'non-aggregating membership' is used.

Note that changing the aggregation scheme can affect the authorisation permissions for your Stash users, and

how directory update operations are performed.

COPY - External user directories

You can connect Stash to external user directories. This allows you to use existing users and groups stored in an enterprise directory, and to manage those users and groups in one place.

User management functions include:

- **Authentication:** Determining which user identity is sending a request to Stash.
- **User management:** Maintaining core information about users accounts.
- **Group membership:** Storing and retrieving groups, and group membership.

It is important to understand that these are separate components of a user management system. You could use an external directory for any or all of the above tasks.

There are several approaches to consider when using external user directories with Stash, described briefly below.

| Documentation | Users and groups | Connecting Stash to an existing LDAP directory
Delegating Stash authentication to an LDAP directory | Connecting Stash to JIRA for user management | Connecting Stash to Crowd |

Notes:

- Connecting Atlassian Stash to your external directory is not sufficient to allow your users to log in to Stash. You must explicitly grant them access to Stash in the [global permission screen](#).
- We recommend that you use groups instead of individual accounts when granting permissions. However, be careful not to add more users to those groups than your Stash license allows. If the license limit is exceeded, your developers will not be able to push commits to repositories, and Stash will display a warning banner. See [this FAQ](#).
- Stash comes with an internal user directory, already built-in, that is enabled by default at installation. When you create the first administrator during the setup procedure, that administrator's username and other details are stored in the internal directory.
- See also this [information about deleting users and groups](#) in Stash.

LDAP

You should consider connecting to an LDAP directory server if your users and groups are stored in an enterprise directory.

There are two common ways of using an external LDAP directory with Stash:

- For full user and group management, and for user authentication — see [Connecting Stash to an existing LDAP directory](#) for instructions.
- For delegated user authentication only, while using Stash's internal directory for user and group management — see [Delegating Stash authentication to an LDAP directory](#) for instructions.

Supported LDAP directory servers:

- Microsoft Active Directory
- Apache Directory Server (ApacheDS) 1.0.x and 1.5.x
- Apple Open Directory (Read-Only)
- Fedora Directory Server (Read-Only Posix Schema)
- Novell eDirectory Server
- OpenDS
- OpenLDAP
- OpenLDAP (Read-Only Posix Schema)
- Generic Posix/RFC2307 Directory (Read-Only)
- Sun Directory Server Enterprise Edition (DSEE)
- Any generic LDAP directory server

JIRA

You can delegate Stash user and group management, as well as user authentication, to an [Atlassian JIRA](#) instance. This is a good option if you already use JIRA in your organization. Note that Stash can only connect to a JIRA server running JIRA 4.3 or later.

You should consider using [Atlassian Crowd](#) for more complex configurations with a large number of users.

See [Connecting Stash to JIRA for user management](#) for configuration instructions.

Crowd

You can connect Stash to [Atlassian Crowd](#) for user and group management, as well as for user authentication.

Crowd is an application security framework that handles authentication and authorisation for your web-based applications. With Crowd you can integrate multiple web applications and user directories, with support for single sign-on (SSO) and centralised identity management. See the [Crowd Administration Guide](#).

You should consider connecting to Crowd if you want to use Crowd to manage existing users and groups in multiple directory types, or if you have users of other web-based applications.

See [Connecting Stash to Crowd](#) for configuration instructions.

Global permissions

Stash uses four levels of account permissions to control user and group access to Stash projects and to the Stash server configuration.

| | Login / Browse | Create projects | Manage users / groups | Manage global permissions | Edit application settings | Edit server config |
|----------------------|----------------|-----------------|-----------------------|---------------------------|---------------------------|--------------------|
| Stash User | ✓ | ✗ | ✗ | ✗ | ✗ | ✗ |
| Project Creator | ✓ | ✓ | ✗ | ✗ | ✗ | ✗ |
| Administrator | ✓ | ✓ | ✓ | ✓ | ✓ | ✗ |
| System Administrator | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |

User accounts that have not been assigned "Stash User" permission or higher, either directly or through group membership, will not be able to log in to Stash. These users are considered unlicensed and do not count towards your Stash license limit.

A user's permission level is displayed on the user's page seen from the admin area.

The screenshot shows a user profile page for 'Kostya Marchenko'. At the top, there are buttons for 'Edit', 'Change password', and 'Delete'. Below the buttons is a placeholder image for the user's avatar. To the right of the image, the user's name 'Kostya Marchenko' is displayed, along with their email address 'marchenko_kostya' and 'kostya@atlassian.com'. Below the email is a red button labeled 'UNLICENSED' with a 'Change permissions' link next to it. At the bottom left, there is a link to 'Change your avatar with Gravatar'.

Note that you can also apply access permissions to projects.

Related pages:

- [Getting started with Stash](#)
- [Users and groups](#)
- [Using project permissions](#)

To edit the account permissions for an existing Stash user or group:

1. Click the 'cog' menu in the header, to go to the admin area.
2. Click **Global permissions** (under 'Accounts').
3. Select, or clear, the permission checkboxes as required.
4. Click in the **Add Users** or **Add Groups** field to set permissions for additional users or groups.

You can remove all permissions for a user or group by clicking the X at the right-hand end of the row (when you hover there). This will remove that user or group.

Global Permissions

Individual Users

| Name | System Admin... | Administrator | Project Creator | Stash User |
|----------------------|-------------------------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| Add Users | | | | |

Setting up your mail server

Setting up Stash to use your SMTP mail server:

- allows Stash to send [notifications](#) about events to do with pull requests. See [Using pull requests in Stash](#). Note that if the mail server fails, notifications will be dropped.
- allows Stash to email a link to a newly created user, which the user can use to generate their own password.
- allows a user to reset his or her password if they forget it.

To configure a mail server for Stash, go to the administration area and click **Mail server** (under 'Settings'). See [Supported platforms](#) for the mail clients supported by Stash.

Complete the form and click **Save**.

| | |
|-----------------|--|
| Hostname | The hostname of the mail server (for example "localhost" or "192.168.1.15"). |
| Port | The port of the mail server (if unspecified, the port 25 will be used). |
| Username | The username to use to connect to the mail server. |
| Password | The password to use to connect to the mail server. |
| Use TLS | Check if the SMTP server you are connecting to uses TLS. |

| | |
|------------|--|
| Email from | Specifies the 'From' header in notification emails (for example: noreply@yourcompany.com). |
|------------|--|

i Anonymous User

If you are looking to setup the outgoing mail server as an anonymous user, simply leave the username and password fields empty. In Chrome, these fields could be auto-populated, leading to an error. Try with another browser to help work around it.

Mail server configuration

Mail settings

Hostname* The hostname of the mail server (for example "localhost" or "192.168.1.15").

Port The port of the mail server (if unspecified, the port 25 will be used).

Username The username to use to connect to the mail server.

Password The password to use to connect to the mail server.

Use TLS Tick if the SMTP server you are connecting to uses TLS.

Email from* Specifies the From: header in notification emails (for example: noreply@yourcompany.com).

[Save](#) [Delete](#) [Cancel](#)

Send a test email

Recipient The email address to send the test message to.

[Test](#)

Configuring the mail server to use Gmail

If you wish to connect to a Gmail account for email notifications in Stash, refer to the [Configuring the Mail Server to Use GMail](#) guide.

In particular, note that Gmail won't show images in the email because of the way that Google loads images on their servers. For Google Apps, a Stash administrator can solve the problem by adding the Stash domain name to a whitelist – see <https://support.google.com/a/answer/3299041?hl=en> for more information.

Linking Stash with JIRA

See [JIRA integration](#) for a description of all the integrations you get when Stash is linked with JIRA.

You can also use JIRA for delegated user management. See [External user directories](#).

This page describes how to link Stash to JIRA.

On this page:

- [Linking Stash with JIRA](#)
- [Restrictions for JIRA integration](#)
- [Restrictions when linking Stash with JIRA Cloud](#)
- [Known issues with JIRA integration](#)
- [Troubleshooting integration with JIRA](#)

Related pages:

- JIRA integration
- JIRA FishEye-Stash Plugin compatibility
- Connecting to JIRA for user management

Linking Stash with JIRA

You can integrate Stash with one or more instances of JIRA by means of 'application links'. You set up application links either:

- during the Stash install process, using the [Setup Wizard](#), or
- at any time after installation, as described below.

To link Stash to a JIRA server:

1. Click **Application Links** (under 'Settings') in the Stash admin area.
2. Enter the URL for the JIRA instance you want to link to and click **Create new link**.
3. Complete the application link wizard to connect Stash to your JIRA server. You *must* make use of the automatic link-back from JIRA to Stash to get full integration (you'll need JIRA system administrator global permission for that).

When you create a new application link between JIRA and an instance of Stash, 2-legged (2LO) and 3-legged OAuth (3LO) are enabled by default. 2LO is required for information from Stash to be included in the summaries in the Development panel of the JIRA issue; 3LO checks that a JIRA user has authenticated with Stash before they get to see the information in any of the details dialogs.

An older application link between JIRA and Stash will need to have 2LO authentication explicitly enabled.

▼ [Click here to see how to enable 2-legged OAuth...](#)

An existing application link between JIRA and Stash (that perhaps used Trusted Apps authentication) needs to have 2-legged authentication (2LO) enabled for both outgoing and incoming authentication, so that information from Stash can be included in the JIRA Development panel summaries.

When updating an older application link to use OAuth, 3-legged authentication is applied by default, but you need to explicitly enable 2LO. Enable 2-legged authentication for the application link from within JIRA as follows:

1. Go to the JIRA admin area and click **Add-ons > Application Links**.
2. Click **Edit** for the app link with the Stash instance.
3. For both **Outgoing Authentication** and **Incoming Authentication**:
 - a. Click **OAuth**
 - b. Check **Allow 2-legged OAuth**.
 - c. Click **Update**.

The application link update process will involve logging you into Stash for a short time to configure that end of the link, before returning you to JIRA.

Note that:

- The following system plugins must be enabled in Stash. These are bundled and enabled by default in Stash 2.10 (and later):
 - Atlassian Navigation Links Plugin (`com.atlassian.plugins.atlassian-nav-links-plugin`)
 - Stash Dev Summary Plugin (`com.atlassian.stash.stash-dev-summary-plugin`).
- Users who can see summarized data in the Development panel may not have permission to see all the information that contributed to those summaries and which is visible in the details dialogs (for example, for branches, commits and pull requests). That is, the details dialogs respect the access permissions that users have in the connected applications.
- When Stash 2.10 or later is linked with JIRA 6.2 or later, you won't see the Source tab at the bottom of the JIRA View Issue screen any more.
- Application links must have Trusted Applications and Basic Access authentication disabled. The Development panel in the JIRA issue view only supports OAuth authentication.

- Stash only begins scanning commit messages for JIRA issue keys on the first push after you created the application link to JIRA – the scan may take a short time.
- Integrating Stash with JIRA may require an upgraded version of the FishEye/Stash plugin in JIRA. See [JIRA FishEye-Stash Plugin compatibility](#) for details about upgrading the JIRA FishEye/Stash plugin, and for download links to the upgraded plugin versions.

More detailed information about application links can be found on [Configuring Application Links](#).

Restrictions for JIRA integration

- The display of [details for JIRA issues](#), for example when viewing a pull request, relies on the JIRA 5.0 REST API. Issue details are not displayed when Stash is integrated with JIRA versions earlier than 5.0.
- Transitioning JIRA issues requires OAuth AppLinks. If only a Basic Auth applink is set up, users will be able to view issue details, but will not be able to transition issues.
- JIRA permissions are respected, so a user who is not permitted to transition an issue in JIRA will not see the transition buttons in Stash.
- If Stash is linked with multiple JIRA instances and the JIRA projects happen to have the same key, only the issue from the instance marked as Primary  will be displayed. See [Making a Primary Link for Links to the Same Application Type](#).

Restrictions when linking Stash with JIRA Cloud

In addition, there are port restrictions, and other limitations, when linking Stash with JIRA Cloud. Please see [Integrating JIRA Cloud with Stash](#).

Known issues with JIRA integration

We have tried to make the integration of JIRA with Stash as straightforward as possible. However, we are aware of the following issue:

- There is no checking for project or issue-key validity; Stash may link to issues that do not actually exist:
 [STASH-2470](#) - JIRA Integration: Check for issue validity before linking issues [OPEN](#)

We apologise for the inconvenience. Please watch the issue to keep track of our progress.

Troubleshooting integration with JIRA

There are a few scenarios where the integration of Stash with JIRA can produce an error:

The application link is misconfigured

This can result if authentication for the application link has not been set up. See [Troubleshooting JIRA Integration](#).

You don't have permission to access the JIRA project

If you don't have permission to access the JIRA project then Stash is unable to display issues.

The JIRA server is of an unsupported version

Stash can integrate with JIRA 4.3.x, or later. Some features require higher versions of JIRA to function properly. See [Integrating Stash with Atlassian applications](#) for details.

The JIRA issue key is invalid

Stash doesn't check for invalid issue keys, such as UTF-8. An error will result if Stash tries to connect to an issue that doesn't exist.

The JIRA issue keys are of a custom format

Stash assumes that JIRA issue keys are of the default format (that is, two or more uppercase letters ([A-Z][A-Z]+), followed by a hyphen and the issue number, for example STASH-123). By default, Stash will not recognise custom JIRA issue key formats. See [Using custom JIRA issue keys with Stash](#) for details.

The Application Link is created with OAuth only without the option to create a link using Trusted Applications

Stash allows a user with global permissions of "Administrator" to create an OAuth only application link. You need to log in with a user having "System Administrator" privileges to create an application link using Trusted Applications.

JIRA FishEye-Stash Plugin compatibility

Some aspects of Atlassian JIRA's support for Stash is built into the FishEye/Stash Plugin that is bundled with JIRA. The plugin allows you to see all of your code changes in one place, even if you're running multiple Atlassian FishEye and Stash servers.

The information on this page applies to Stash versions 2.1 and later.

On this page:

- Supported JIRA versions
- Plugin upgrade guide

Related pages:

- [JIRA integration](#)
- [Linking Stash with JIRA](#)
- [Stash releases](#)

Supported JIRA versions

If you're using a version of JIRA earlier than **5.0.3** you may need to upgrade the FishEye/Stash plugin in JIRA to get support for Atlassian Stash.

| JIRA Version | Compatibility | FishEye/Stash Plugin URL |
|--------------|--|---|
| 5.0.4+ | Works straight out of the box! | NA |
| 5.0-5.0.3 | Requires JIRA FishEye/Stash Plugin 5.0.4.1 | https://maven.atlassian.com/content/repositories/atlassian-contrib/com/atlassian/jira-fisheye-plugin/5.0.4.1/jira-fisheye-plugin-5.0.4.1.jar |

Limited support for JIRA 4.4.x and earlier

JIRA 4.3+ allows for showing commits associated with issues in JIRA. However, viewing issues within Stash is restricted.

| | | |
|------------------|---|---|
| 4.4.x | Requires JIRA FishEye/Stash Plugin 3.4.12 | https://maven.atlassian.com/content/repositories/atlassian-contrib/com/atlassian/jira-fisheye-plugin/3.4.12/jira-fisheye-plugin-3.4.12.jar |
| 4.3.x | Requires JIRA FishEye/Stash Plugin 3.1.8 | https://maven.atlassian.com/contrib/com/atlassian/jira/plugins/jira-fisheye-plugin/3.1.8/jira-fisheye-plugin-3.1.8.jar |
| Earlier versions | JIRA-to-Stash integration is unsupported | NA |

Plugin upgrade guide

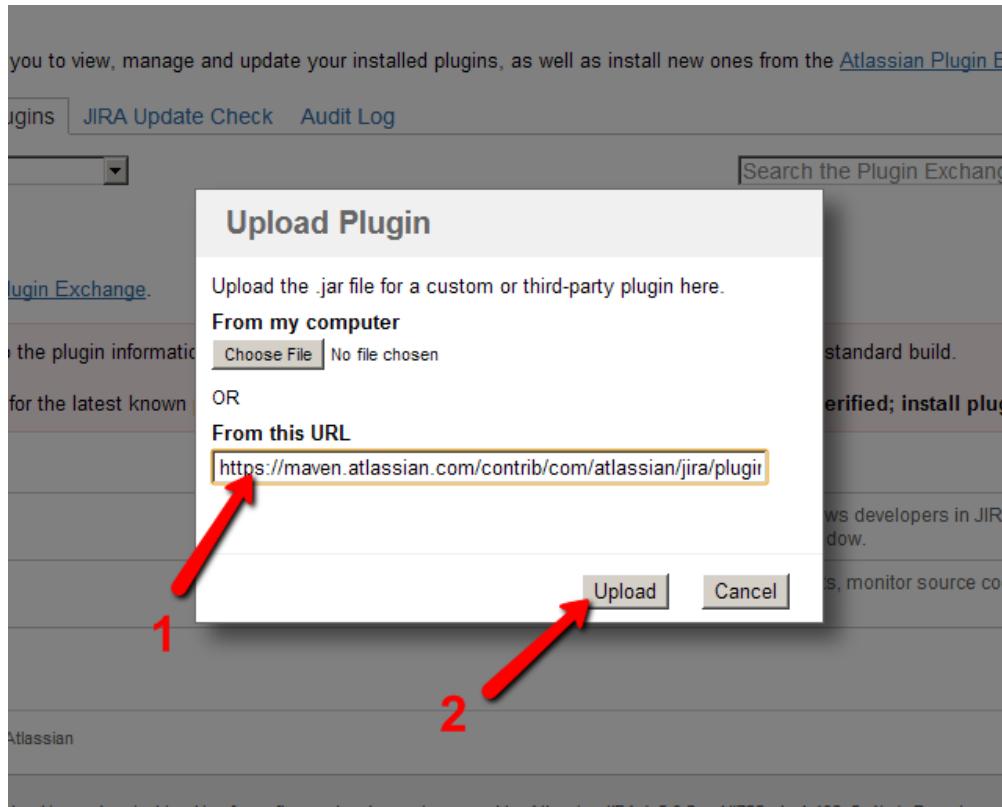

To upgrade the FishEye/Stash Plugin, copy the link from the table above that matches your JIRA version. Then navigate in JIRA to **Administration > Plugins**.

The screenshot shows the JIRA Administration interface. In the top navigation bar, 'Administration' is selected. The main content area is titled 'Administration'. Under 'Recent Projects', there are four items: JIRA (25,394 Issues), Atlassian Stash (ST, 5 Issues), Crowd (CWD, 2,716 Issues), and FishEye Crucible Development (FECRU, 1,944 Issues). Below this, the 'Plugins' section is expanded, showing sub-links: 'Plugins' (with a red arrow pointing to it), 'Application Links', 'Source Control', 'Builds', 'Agile', 'Testing', 'Issue Collectors', and 'Other'. At the bottom of the sidebar, there are links for 'Bonfire Settings', 'Bonfire License', 'Bonfire Support', 'Issue Collectors', and 'Balsamiq Mockups License'.

Next, select the **Install Plugins** tab and click **Upload Plugin**.

The screenshot shows the JIRA Plugins page. The top navigation bar includes 'Administration', 'Projects', 'Plugins' (selected), 'Users', 'Issues', and 'System'. The main title is 'Plugins'. Below it, a sub-section titled 'Install Plugins' is shown with a red arrow labeled '1' pointing to its tab. The text says: 'The Universal Plugin Manager allows you to view, manage and update your installed plugins, as well as install new ones from the [Atlassian Plugin Exchange](#)'. There are tabs for 'Manage my plugins', 'Install Plugins' (highlighted in blue), 'JIRA Update Check', and 'Audit Log'. A search bar at the top right has 'Search' and 'Clear' buttons. Below the tabs, there's a dropdown for 'Plugins to show' set to 'Featured' and a search bar with placeholder 'Search the Plugin Exchange'. A red arrow labeled '2' points to the 'Upload Plugin' button on the right. The 'Featured Plugins' section lists two items: 'Go2Group JAM Plugin' and 'JIRA DVCS Connector'. At the bottom, it says 'The Universal Plugin Manager (v2.0.5) by Atlassian' and 'Bug tracking and project tracking for software development powered by Atlassian JIRA (v5.0.2-rc1#725-sha1:406a5e4) | Report a problem'.

Now paste the URL copied from the table above into the **From this URL** field, and click **Upload**.

You should see that the plugin is installed. Now you can continue integrating Atlassian Stash with your JIRA server. See [JIRA integration](#) for details.

JIRA 4.3.x Upgrade Note

When upgrading the plugin in JIRA 4.3.x you may see a "zip file closed" error message in the logs. This can be ignored. See "[IllegalStateException: zip file closed](#)" when upgrading JIRA FishEye/Stash Plugin in JIRA 4.3 for more details.

Using custom JIRA issue keys with Stash

Stash assumes that JIRA issue keys are of the default format (that is, two or more uppercase letters ([A-Z][A-Z]+), followed by a hyphen and the issue number, for example STASH-123). By default, Stash will not recognise custom JIRA issue key formats.

You can use custom JIRA issue key formats with Stash, however note that integrations with JIRA can depend on using the default issue key format in both JIRA and Stash. See [Integrating using custom JIRA issue keys](#) for more details.

Configure Stash to recognize custom issue key formats by editing <Stash installation directory>/bin/setenv.sh (on Windows, edit <Stash installation directory>/bin/setenv.bat instead).

To override the default issue key format, use the `JVM_SUPPORT_RECOMMENDED_ARGS` property, like this:

Stash 2.8, and later:

```
JVM_SUPPORT_RECOMMENDED_ARGS="-Dintegration.jira.key.pattern=\"(<Some different
regex>)\""
```

Stash versions up to 2.7.x:

```
JVM_SUPPORT_RECOMMENDED_ARGS="-Dstash.jira.key.pattern=\"(<Some different  
regex>)\\""
```

Notice that the parameter name was changed for Stash 2.8.

You will need to restart Stash.

For example, to use lowercase letters in issue keys, use a regex with the parameter like this:

Stash 2.8, and later:

```
"-Dintegration.jira.key.pattern=\"((?<!([a-z]{1,10})-?)[a-z]+-\d+)\\""
```

Stash versions up to version 2.7.x:

```
"-Dstash.jira.key.pattern=\"((?<!([a-z]{1,10})-?)[a-z]+-\d+)\\""
```

See also [Reindex JIRA issue keys](#).

As always, please back up your home directory (and perhaps the database) before performing any manual operation on Stash. Consider testing this change on another copy of Stash before using it in production.

Connecting Stash to an external database

This page provides information about using Stash with an external database.

Stash ships with an embedded database that it uses straight out-of-the-box, with no configuration required. This is great for evaluation purposes, but for production installations we recommend that you use one of the supported external databases.

Instructions for connecting Stash to the supported external databases:

- [Connecting Stash to PostgreSQL](#)
- [Connecting Stash to Oracle](#)
- [Connecting Stash to SQL Server](#)
- [Connecting Stash to MySQL](#) -  note: not recommended

Please refer to [Supported platforms](#) for the versions of external databases supported by Stash.

Related pages:

- [How do I change the external database password](#)

Why would I want to use an external database?

Stash ships with an embedded database that is great for evaluation purposes, but for production installations we recommend that you make use of one of the [supported external databases](#), for the following reasons:

- **Improved protection against data loss:** The Stash built-in database, which runs [HSQLDB](#), is susceptible to data loss during system crashes. External databases are generally more resistant to data loss during a system crash. HSQLDB is not supported in production environments and should only be used for evaluation purposes.
- **Performance and scalability:** If you have a large number of users on your Stash instance, running the database on the same server as Stash may slow it down. We recommend that for large installations, Stash and the DBMS are run on separate machines. When using the embedded database, the database will always be hosted and run on the same server as Stash, which will limit performance.

- **Unified back-up:** Use your existing DBMS tools to back up your Stash database alongside your organisation's other databases.

Using the Database Migration Wizard

You can use the Database Migration Wizard to migrate the Stash data:

- from the embedded database to a [supported](#) external DBMS.
- to another instance of the same DBMS.
- from one DBMS to another supported DBMS (for example, from MySQL to PostgreSQL).

You need to have created the DBMS (such as PostgreSQL) that you wish to migrate the Stash data to before running the Migration Wizard.

To run the Database Migration Wizard:

1. Log in to Stash.
2. In the administration area, click **Database** (under 'Settings').
3. Click **Migrate database** and follow the instructions for running the migration.

Notes about database migration

- **Back up the database and Stash home directory:**

Before starting the database migration process you should back up your [Stash home directory](#). If you intend to migrate from one external database to another, you should also backup the existing database before proceeding. See [Data recovery and backups](#) for more information.

- **Stash will be unavailable during the migration:**

Stash will not be available to users during the database migration operation. In addition, running the migration when people are using Stash can sometimes cause the migration to time out waiting for all activity in Stash that uses the database to complete. For these reasons we recommend that you run the database migration outside of normal usage periods.

- **Migration will usually take less than 30 minutes:**

The duration of the migration process depends on the amount of data in the Stash database being migrated. For new installations of Stash, containing very little data, the migration process typically takes just a few seconds. If you have been using Stash for some time, its database will contain more data, and the migration process will therefore take longer. If Stash has been linked to a JIRA instance, and there are hundreds of thousands of commits in Stash with JIRA keys in the commit messages, the migration may take tens of minutes.

- **We strongly recommend using a new clean database for the new Stash database:**

In case of a migration failure, Stash may have partially populated the target database. If the target database is new (therefore empty) and set aside for Stash's exclusive use, it's very easy to clean up after a failed migration; just drop the target database and use a clean target database instance for the next attempt.

- **Ensure your Stash home directory is secured against unauthorised access:**

- After the migration, the connection details (including the username and password) for the database are stored in the `stash-config.properties` file.
- Migration will create a dump file of the contents of your database in the [Stash home](#) export directory. This is used during the migration and is kept for diagnostic purposes in the case of an error. You may remove this after migration but it may reduce Atlassian Support's ability to help you in the case of migration issues.
- You can [edit the database password](#) if needed after migration.

Connecting Stash to MySQL

This page describes how to connect Stash to a MySQL database.

MySQL performance issues

MySQL, while supported by Stash, is currently **not** recommended especially in larger instances, due to inherent performance and deadlock issues that occur in this database engine under heavy load.

Affected systems may experience slow response times, deadlock errors and in extreme cases errors due to running out of database connections. These issues are intrinsic to MySQL (no other database engine in Stash's [Supported platforms](#) shares this behavior) and are due to the way MySQL performs row-level locking in transactions. See <http://dev.mysql.com/doc/refman/5.0/en/innodb-deadlocks.html> for some general information on this.

Stash does its best to work around the MySQL behavior - see issues [STASH-4517](#), [STASH-4701](#) and others for example. However, under very heavy load you will generally get better performance with any of the other database engines supported by Stash (such as PostgreSQL which is also freely available) than you will with MySQL. Please see [Connecting Stash to an external database](#) for instructions on migrating your data to one of these other engines.

Related pages:

- [Connecting Stash to an external database](#)
- [Connecting Stash to Oracle](#)
- [Connecting Stash to PostgreSQL](#)
- [Connecting Stash to SQL Server](#)

MySQL 5.6.x Compatibility

Note that Stash is not compatible at all with versions of MySQL 5.6 earlier than 5.6.16 because of bugs in its query optimizer ([#68424](#), [#69005](#)). Please watch [STASH-3164](#) for further updates on this. Stash does support versions of MySQL 5.6 from 5.6.16 on.

See [Supported platforms](#) for the versions of MySQL supported by Stash.

The overall process for using a MySQL database with Stash is:

1. Install MySQL where it is accessible to Stash. It is assumed here that you already have MySQL installed and running. See the MySQL documentation at <http://dev.mysql.com/doc/>.
2. Create the database and user on the MySQL server for Stash to use.
3. Download and install the JDBC driver.
4. Migrate Stash to the MySQL database.

Create the Stash database

Before you can use Stash with MySQL, you must set up the MySQL server as follows:

| Step | Notes |
|----------------------|--|
| Create database | Create a database on MySQL for Stash to use. |
| Create database user | Create a Stash user on the database. |
| Character encoding | Configure the database to use <code>utf8</code> character set encoding.
Note that Stash on MySQL does not support <code>4 byte UTF-8</code> characters. |
| Collation | Configure the database to use <code>utf8_bin</code> collation (to ensure case sensitivity). |
| Logging format | If MySQL is using binary logging, configure the database to use a binary logging format of either <code>MIXED</code> or <code>ROW</code> .
Refer to the MySQL documentation . Note that Stash sets the MySQL transaction isolation level to <code>READ-COMMITTED</code> when it connects to the database. |

| | |
|--------------------|--|
| Connection timeout | Stash requires the database to keep idle connections alive for at least 10 minutes. If the database is configured with less than a 10 minute connection timeout, there will be seemingly random connection errors. |
|--------------------|--|

Here is an example of how to do that. When Stash and MySQL run on the same physical computer (accessible through `localhost`), run the following commands (replacing `stashuser` and `password` with your own values):

```
mysql> CREATE DATABASE stash CHARACTER SET utf8 COLLATE utf8_bin;
mysql> GRANT ALL PRIVILEGES ON stash.* TO 'stashuser'@'localhost' IDENTIFIED BY
'password';
mysql> FLUSH PRIVILEGES;
mysql> QUIT
```

This creates an empty MySQL database with the name `stash`, and a user that can log in from the host that Stash is running on who has full access to the newly created database. In particular, the user should be allowed to create and drop tables, indexes and other constraints.

If the MySQL database and Stash servers are on the same physical computer, you can use `localhost` and *not set a password* by omitting `IDENTIFIED BY 'password'` from the 2nd MySQL statement above (if you trust the security *within* this computer).

If the MySQL database and Stash servers are on different computers, just replace the `localhost` part of the `GRANT ALL` statement above with the hostname of the machine that Stash is running on. See the documentation at <http://dev.mysql.com/doc/refman/5.1/en/account-names.html>.

Note that Stash will generally require about 25–30 connections to the database. The maximum number of connections is a configurable system property – see [Database pool](#).

Download and install the JDBC driver

The JDBC drivers for MySQL are *not* bundled with Stash (due to licensing restrictions). You need to download and install the driver yourself, after you have installed Stash.

1. Download the MySQL Connector/J JDBC driver from the [download site](#).
2. Expand the downloaded zip/tar.gz file.
3. Copy the `mysql-connector-java-5.1.XX-bin.jar` file from the extracted directory to your `<Stash home directory>/lib` directory (for Stash 2.1 or later).
4. Stop, and then restart Stash. See [Starting and stopping Stash](#).

Migrate Stash to the MySQL database

You can migrate Stash to the MySQL database created above, either from the embedded database or from another external database.

The migration process makes a backup of your existing Stash database in `exports` under the Stash `home directory`. See [Data recovery and backups](#) for further information about backing up Stash.

Run the migration as follows:

1. In the administration area, click **Database** (under 'Settings').
2. Click **Migrate database**.
3. Select **MySQL** for **Database Type**.
4. Complete the form. See the table below for details.
5. Click **Start Migration**.

See [these notes](#) about database migration.

| | |
|--------------------------|--|
| Hostname | The host name or IP address of the computer running the database server. |
| Port | The TCP port with which Stash can connect to the database server. The default value is the default port that MySQL runs against. You can change that if you know the port that your MySQL instance is using. |
| Database name | The name of the database that Stash should connect to. |
| Database username | The username that Stash should use to access the database. |
| Database password | The password that Stash should use to access the database. |

Migrate Database

Stash will be unavailable to users while a migration is in progress. See our [documentation](#) for more information.

Database Type: MySQL
Hostname:
Port: 3306
Database name:
Database username:
Database password:

Start Migration **Test** **Cancel**

Connecting Stash to Oracle

This page describes how to connect Stash to a Oracle database.

The overall process for using a Oracle database with Stash is:

- Install Oracle where it is accessible to Stash.
- Create a database and user on the Oracle server for Stash to use.
- Install Stash on Windows, or on Linux or Mac. See [Getting started](#).
- Either:
 - at Stash install time, run the Setup Wizard to connect Stash to the Oracle database, or
 - at a later time, migrate Stash to the Oracle database. See [Using the Database Migration Wizard](#) .

It is assumed here that you already have Oracle installed and running. For information about installing Oracle and creating Oracle databases, see the [Oracle documentation pages](#). For the versions of Oracle supported by Stash see [Supported platforms](#).

On this page:

- [Prerequisites](#)
- [Connect Stash to the Oracle database](#)
- [Install the JDBC driver](#)

Related pages:

- [Connecting Stash to an external database](#)
- [Connecting Stash to MySQL](#)
- [Connecting Stash to PostgreSQL](#)
- [Connecting Stash to SQL Server](#)

Prerequisites

Backup

If you are migrating your data from the internal Stash database, back up the Stash home directory.

If you are migrating your Stash data from a different external database, back up that database by following the instructions provided by the database vendor before proceeding with these instructions.

See [Data recovery and backups](#).

Create the Stash database

Before you can use Stash with Oracle, you must set up Oracle as follows:

- Ensure that you have a database instance available for Stash (either create a new one or use an existing one)
The character set of the database must be set to either AL32UTF8 or UTF8, to support storage of Unicode data as per the [Oracle documentation](#).
Note that it is important to the proper operation of Stash that the database store its data in a case-sensitive manner. By changing the values of the `NLS_COMP` and/or `NLS_SORT` variables, it is possible to cause Oracle to perform its searches in a case-insensitive manner. We therefore strongly recommend that those variables be left at their default values.
- Create a user that Stash will connect as (e.g. `stash`).
 Remember the database user name; it will be used to configure Stash's connection to the database in subsequent steps.
i When you create a user in Oracle, a schema is automatically created.
It is strongly recommended that you create a new database user for use by Stash rather than sharing one that is used by other applications or people.
- Grant the Stash user `connect` and `resource` roles only. The `connect` role is required to set up a connection, while `resource` role is required to allow the user to create objects in its own schema.
- Create a local `all_objects` view to the user's schema, so that there is no possibility that a table with the same name as one of the Stash tables in another schema will cause any conflicts.
- Note that Stash requires the database to keep idle connections alive for at least 10 minutes. If the database is configured with less than a 10 minute connection timeout, there will be [seemingly random connection errors](#).

The format of the command to create a user in Oracle is:

```
CREATE USER <user>
  IDENTIFIED BY <password>
  DEFAULT TABLESPACE USERS
  QUOTA UNLIMITED ON USERS;
GRANT CONNECT, RESOURCE to <user>;
CREATE VIEW <user>.all_objects AS
  SELECT *
    FROM sys.all_objects
   WHERE owner = upper('<user>');
```

Here is a simple example, using SQL*Plus, of how one might create a user called `stash` with password `jdHyd6Sn21` in tablespace `users`, and grant the user a minimal set of privileges. When you run the command on your machine, remember to replace the user name, password and tablespace names with your own values.

```
CREATE USER stash
  IDENTIFIED BY jdHyd6Sn21
  DEFAULT TABLESPACE USERS
  QUOTA UNLIMITED ON USERS;
GRANT CONNECT, RESOURCE to stash;
CREATE VIEW stash.all_objects AS
  SELECT *
    FROM sys.all_objects
   WHERE owner = upper('stash');
```

This creates an empty Oracle schema with the name `stash`, and a user that can log in from the host that Stash is running on and who has full access to the newly created schema. In particular, the user is allowed to create sessions and tables.

Stash will generally require about 25–30 connections to the database. The maximum number of connections is a configurable system property – see [Database pool](#).

Connect Stash to the Oracle database

You can now connect Stash to the Oracle database, either:

- when you run the Setup Wizard, at install time,
- when you wish to migrate to Oracle, either from the embedded Stash database or from another external database.

When running the Setup Wizard at install time

1. Select **External** at the 'Database' step.
2. Select **Oracle** for **Database Type**.
3. Complete the form. See the table below for details.
4. Click **Next**, and follow the instructions in the Stash Setup Wizard.

When migrating to Oracle

1. In the Stash administration area, click **Database** (under 'Settings').
2. Click **Migrate database**.
3. Select **Oracle** for **Database Type**.
4. Complete the form. See the table below for details.
5. Click **Start Migration**.

| | |
|--------------------------|--|
| Hostname | The host name or IP address of the computer running the Oracle server. |
| Port | The TCP port with which Stash can connect to the database server. The default value is the default port that Oracle runs against. You can change that if you know the port that your Oracle instance is using. |
| Database name | The system identifier of the Oracle instance that Stash should connect to. Stash does not support connecting to Oracle servers which are using SIDs or TNS Alias to identify themselves; it requires the fully qualified Service Name instead. |
| Database username | The username that Stash should use to access the database. |
| Database password | The password that Stash should use to access the database. |

Migrate Database

Stash will be unavailable to users while a migration is in progress. See our [documentation](#) for more information.

Database Type: Oracle
Hostname*: localhost
Port*: 1521
Database name*: stash
Database username*: stash
Database password*: stash

Start Migration **Test** **Cancel**

Install the JDBC driver

This section is only relevant to some distributions of Stash, for example if you are running Stash via the Atlassian Plugin SDK, or have built Stash from source.

If the Oracle JDBC driver is *not* bundled with Stash, you will need to download and install the driver yourself.

1. Download the appropriate JDBC driver from the Oracle [download site](#).
2. Copy the downloaded jar file to your <Stash home directory>/lib directory (for Stash 2.1 or later).
3. Stop, then restart, Stash. see [Starting and stopping Stash](#).

Connecting Stash to PostgreSQL

This page describes how to connect Stash to a PostgreSQL database.

The overall process for using a PostgreSQL database with Stash is:

- Install PostgreSQL where it is accessible to Stash.
- Create a database and user on the PostgreSQL server for Stash to use.
- Install Stash on Windows, or on Linux or Mac. See [Getting started](#).
- Either:
 - at Stash install time, run the Setup Wizard to connect Stash to the PostgreSQL database, or
 - at a later time, migrate Stash to the PostgreSQL database. See [Using the Database Migration Wizard](#).

It is assumed here that you already have PostgreSQL installed and running. For more information about PostgreSQL installation and operation, refer to the [PostgreSQL documentation](#).

PostgreSQL has the idea of schemas. When you create a PostgreSQL database, a 'public' schema is created and set as the default for that database. It is possible to create a different schema (e.g. 'stash') and set that as the default schema. Stash will use whatever schema is set as the default for the logged-in user. Stash does not provide a way for a user to nominate the schema to use; it uses schema that is set as the PostgreSQL default.

See [Supported platforms](#) for the versions of PostgreSQL supported by Stash.

On this page:

- Prerequisites
- Connect Stash to the PostgreSQL database
- Install the JDBC driver

Related pages:

- [Connecting Stash to an external database](#)
- [Connecting Stash to MySQL](#)
- [Connecting Stash to Oracle](#)
- [Connecting Stash to SQL Server](#)

Prerequisites

Backup

If you are migrating your Stash data from the HSQL internal database, back up the Stash home directory.

If you are migrating your Stash data from another external database, back up that database by following the instructions provided by the database vendor before proceeding with these instructions.

See [Data recovery and backups](#).

Create the Stash database

Before you can use Stash with PostgreSQL, you must:

- Create a role for Stash to use when it connects to the database.
We strongly recommend that this role be established for Stash's use exclusively; it should not be shared by other applications or people.
- Create a database in which Stash can store its data.
The database must be configured to use the UTF-8 character set.
During normal operation, Stash will acquire 25–30 connections to the database. The maximum number of connections is a configurable system property – see [Database pool](#).
- Note that Stash requires the database to keep idle connections alive for at least 10 minutes. If the database is configured with less than a 10 minute connection timeout, there will be [seemingly random connection errors](#).

Here is an example of how to create a user called `stashuser` with password `jellyfish`, and a database called `stash`, which is configured for use by `stashuser`. Using a PostgreSQL client application like `psql` or `pgAdmin`, run the following commands, replacing the user name, password, and database name with your own values.

```
CREATE ROLE stashuser WITH LOGIN PASSWORD 'jellyfish' VALID UNTIL 'infinity';

CREATE DATABASE stash WITH ENCODING='UTF8' OWNER=stashuser CONNECTION LIMIT=-1;
```

If the server that is hosting the PostgreSQL database is not the same server as Stash, then please ensure that the Stash server can connect to the database server. Please also refer to the [PostgreSQL documentation on how to set up pg_hba.conf](#). If the `pg_hba.conf` file is not set properly, remote communication to the PostgreSQL server will fail.

Connect Stash to the PostgreSQL database

You can now connect Stash to the PostgreSQL database, either:

- when you run the Setup Wizard, at install time,
- when you wish to migrate Stash to PostgreSQL, either from the embedded HSQL database or from another external database.

When running the Setup Wizard at install time

1. Select **External** at the 'Database' step.
2. Select **PostgreSQL for Database Type**.
3. Complete the form. See the table below for details.
4. Click **Next**, and follow the instructions in the Stash Setup Wizard.

When migrating to PostgreSQL

1. In the Stash administration area, click **Database** (under 'Settings').
2. Click **Migrate database**.
3. Select **PostgreSQL for Database Type**.
4. Complete the form. See the table below for details.
5. Click **Start Migration**.

| | |
|-----------------|--|
| Hostname | The host name or IP address of the computer running the database server. |
|-----------------|--|

| | |
|--------------------------|--|
| Port | The TCP port with which Stash can connect to the database server. The default value is the default port that PostgreSQL runs against. You can change that if you know the port that your PostgreSQL instance is using. |
| Database name | The name of the database that Stash should connect to. |
| Database username | The username that Stash should use to access the database. |
| Database password | The password that Stash should use to access the database. |

Migrate Database

Stash will be unavailable to users while a migration is in progress. See our documentation for more information.

Database Type: PostgreSQL
 Hostname:
 Port: 5432
 Database name:
 Database username:
 Database password:
 Start Migration | Test | Cancel

Install the JDBC driver

This section is only relevant to some distributions of Stash, for example if you are running Stash via the Atlassian Plugin SDK, or have built Stash from source.

If the PostgreSQL JDBC driver is *not* bundled with Stash, you will need to download and install the driver yourself.

1. Download the appropriate JDBC driver from the [Postgres download site](#).
2. Copy the downloaded jar file to your <Stash home directory>/lib directory (for Stash 2.1 or later).
3. Stop, then restart, Stash. See [Starting and stopping Stash](#).

Connecting Stash to SQL Server

This page describes how to connect Stash to a Microsoft SQL Server database.

The overall process for using a SQL Server database with Stash is:

- Install SQL Server where it is accessible to Stash.
- Create a database and user on the SQL Server server for Stash to use.
- Install Stash on Windows, or on Linux or Mac. See [Getting started](#).
- Either:
 - at Stash install time, run the Setup Wizard to connect Stash to the SQL Server database, or
 - at a later time, migrate Stash to the SQL Server database. See [Using the Database Migration Wizard](#).

It is assumed here that you already have SQL Server installed and running.

- SQL Server documentation is available at <http://msdn.microsoft.com/en-us/library/bb545450.aspx>.
- JDBC documentation is available at <http://msdn.microsoft.com/en-us/library/ms378672.aspx>.

See [Supported platforms](#) for the versions of SQL Server supported by Stash.

On this page:

- Prerequisites
- Connect Stash to the SQL Server database
- Use Integrated Authentication or 'Windows Authentication Mode' (Optional)
- Install the JDBC driver

Related pages:

- Transitioning from JTDS to Microsoft's JDBC driver
- Connecting Stash to an external database
- Connecting Stash to MySQL
- Connecting Stash to Oracle
- Connecting Stash to PostgreSQL

Prerequisites

Back up your current database

If you are migrating your data from the internal Stash database, back up the [Stash home directory](#).

If you are migrating your Stash data from a different external database, back up that database by following the instructions provided by the database vendor before proceeding with these instructions.

See [Data recovery and backups](#).

Create the Stash database

Before you can use Stash with SQL Server, you must set up SQL Server as follows:

| Step | Notes |
|-------------------------------|--|
| Create a database | e.g. stash. Remember this database name for the connection step below. |
| Set the collation type | This should be case-sensitive, for example, 'SQL_Latin1_General_CP1_CS_AS' (CS = Case Sensitive). |
| Set the isolation level | Configure the database to use the isolation level, Read Committed with Row Versioning. |
| Create a database user | e.g. stashuser. This database user should not be the database owner, but should be in the db_owner role. See SQL Server Startup Errors . Remember this database user name for the connection step below. |
| Set database user permissions | The Stash database user has permission to connect to the database, and to create and drop tables, indexes and other constraints, and insert and delete data, in the newly-created database. |
| Enable TCP/IP | Ensure that TCP/IP is enabled on SQL Server and that SQL Server is listening on the correct port (which is 1433 for a default SQL Server installation). Remember this port number for the connection step below. |

| | |
|-------------------------------|--|
| Check the authentication mode | <p>Ensure that SQL Server is operating in the appropriate authentication mode. By default, SQL Server operates in 'Windows Authentication Mode'. However, if your user is not associated with a trusted SQL connection, 'Microsoft SQL Server, Error: 18452' is received during Stash startup, and you will need to change the authentication mode to 'Mixed Authentication Mode'.</p> <p><i>Stash instances running on Windows are also able to support SQL Server databases running in 'Windows Authentication Mode'. This is described at the bottom of this page and it has to be manually configured: Connecting Stash to SQL Server - Use Integrated Authentication (Optional)</i></p> |
| Check that SET NOCOUNT is off | <p>Ensure that the SET NOCOUNT option is turned off. You can do that in SQL Server Management Studio as follows:</p> <ol style="list-style-type: none"> 1. Navigate to Tools > Options > Query Execution > SQL Server > Advanced. Ensure that the SET NOCOUNT option is cleared. 2. Now, go to the Server > Properties > Connections > Default Connections properties box and clear the no count option. |

Note that Stash will generally require about 25–30 connections to the database.

Note also that Stash requires the database to keep idle connections alive for at least 10 minutes. If the database is configured with less than a 10 minute connection timeout, there will be [seemingly random connection errors](#).

Here is an example of how to create and configure the SQL Server database from the command line. When Stash and SQL Server run on the same physical computer (accessible through `localhost`), run the following commands (replacing `stashuser` and `password` with your own values):

```
SQL Server> CREATE DATABASE stash
SQL Server> GO
SQL Server> USE stash
SQL Server> GO
SQL Server> ALTER DATABASE stash SET ALLOW_SNAPSHOT_ISOLATION ON
SQL Server> GO
SQL Server> ALTER DATABASE stash SET READ_COMMITTED_SNAPSHOT ON
SQL Server> GO
SQL Server> ALTER DATABASE stash COLLATE SQL_Latin1_General_CI_AS
SQL Server> GO
SQL Server> SET NOCOUNT OFF
SQL Server> GO
SQL Server> USE master
SQL Server> GO
SQL Server> CREATE LOGIN stashuser WITH PASSWORD=N'password',
DEFAULT_DATABASE=stash, CHECK_EXPIRATION=OFF, CHECK_POLICY=OFF
SQL Server> GO
SQL Server> ALTER AUTHORIZATION ON DATABASE::stash TO stashuser
SQL Server> GO
```

This creates an empty SQL Server database with the name `stash`, and a user that can log in from the host that Stash is running on who has full access to the newly created database. In particular, the user should be allowed to create and drop tables, indexes and other constraints.

Connect Stash to the SQL Server database

You can now connect Stash to the SQL Server database, either:

- when you run the Setup Wizard, at install time,
- when you wish to migrate to SQL Server, either from the embedded database or from another external database.

When running the Setup Wizard at install time

1. Select **External** at the 'Database' step.

2. Select **SQL Server** for **Database Type**.
3. Complete the form. See the table below for details.
4. Click **Next**, and follow the instructions in the Stash Setup Wizard.

When migrating to SQL Server

1. In the Stash administration area, click **Database** (under 'Settings').
2. Click **Migrate database**.
3. Select **SQL Server** for **Database Type**.
4. Complete the form. See the table below for details.
5. Click **Start Migration**.

| | |
|--------------------------|--|
| Hostname | The host name or IP address of the computer running the database server. |
| Port | The TCP port with which Stash can connect to the database server. The default value of 1433 is the default port that SQL Server runs against. You can change that if you know the port that your SQL Server instance is using. |
| Database name | The name of the database that Stash should connect to. |
| Database username | The username that Stash should use to access the database. |
| Database password | The password that Stash should use to access the database. |

Migrate Database

Stash will be unavailable to users while a migration is in progress. See our [documentation](#) for more information.

Database Type: Microsoft SQL Server

Hostname*: [Input field]

Port*: 1433

Database name*: [Input field]

Database username*: [Input field]

Database password*: [Input field]

Start Migration **Test** **Cancel**

Named Instances

If you have a named instance on your server, you will need to manually edit the `stash-config.properties` file as described on the [Connecting to named instances in SQL Server from Stash](#) Knowledge Base article.

Use Integrated Authentication or 'Windows Authentication Mode' (Optional)

Windows authentication is only available for Stash instances running on Windows. It cannot be used on Linux because Microsoft does not provide shared objects for it. You will either need to run Stash on Windows, allowing you to use Windows security, or you will need to enable mixed-mode authentication for SQL Server if you are running Stash on Linux. Unfortunately, there are no other options at this time.

Integrated authentication uses a native DLL to access the credentials of the logged-in user to authenticate with SQL Server. The native DLLs for both 32- and 64-bit systems are included in the distribution; there is no need to download the entire package from Microsoft.

Stash does not currently support configuring the system to use integrated authentication from the UI (Vote for it!)

 STASH-3035 - Add support for integrated authentication for Microsoft SQL Server [OPEN](#)). This means you can't currently

migrate to SQL Server with integrated authentication, nor can you configure Stash to use SQL Server with integrated authentication during initial setup. However, if Stash has already been configured to use SQL Server (for example, when the Setup Wizard was run at first use), you can enable integrated authentication by directly modifying Stash's configuration, as follows:

1. Based on the JVM being used to run Stash, rename either the x64 or x86 DLL to `sqljdbc_auth.dll` in `lib/native`. Note that running on Windows x64 does *not* require the use of the x64 DLL; you should only use the x64 DLL if you are also using a 64-bit JVM.
2. In `setenv.bat`, a `JVM_LIBRARY_PATH` variable has already been defined. Simply remove the leading `rem`. Note that if you are putting the native DLL in an alternative location, you may need to change the value to point to your own path. The value of the `JVM_LIBRARY_PATH` variable will automatically be included in the command line when Tomcat is run using `start-stash.bat`.
3. Edit the `%STASH_HOME%\stash-config.properties` file to include `;integratedSecurity=true` in the `jdbc.url` line. Note that `jdbc.user` and `jdbc.password` will no longer be used to supply credentials *but they must still be defined* – Stash will fail to start if these properties are removed.
4. Ensure the Stash process or service is running as the correct user to access SQL Server. (Note that this user is generally a Windows Domain User Account, but should not be a member of any administrators groups, that is local, domain, or enterprise.)

 It is also possible to configure integrated authentication over Kerberos, rather than using the native DLLs. Details for that are included in the [JDBC documentation](#).

Install the JDBC driver

This section is only relevant to some distributions of Stash, for example if you are running Stash via the Atlassian Plugin SDK, or have built Stash from source.

If the SQL Server JDBC driver is *not* bundled with Stash, you will need to download and install the driver yourself.

1. Download the appropriate JDBC driver from the Microsoft [download site](#).
2. Install the driver file to your `<Stash home directory>/lib` directory (for Stash 2.1 or later).
3. Stop, then restart, Stash. See [Starting and stopping Stash](#).

If Stash was configured to use Microsoft SQL Server by manually entering a JDBC URL, please refer to [this guide](#).

Transitioning from jTDS to Microsoft's JDBC driver

This page describes how to change from using jTDS to using the Microsoft SQL Server JDBC driver to access Microsoft SQL Server.

What do I have to do?

If Stash was configured to use Microsoft SQL Server by following the steps outlined in [Connecting Stash to SQL Server](#), *no change is necessary*. However, If Stash was configured to use Microsoft SQL Server by **manually entering a JDBC URL**, the system will lock on startup if the driver class and URL are not manually updated.

How to proceed

In the `Stash home directory`, `stash-config.properties` must be edited to change the JDBC driver and URL. The existing configuration should look similar to this:

```
jdbc.driver=net.sourceforge.jtds.jdbc.Driver  
jdbc.url=jdbc:jtds:sqlserver://localhost:1433;databaseName=stash;  
jdbc.user=stashuser  
jdbc.password=secretpassword
```

 The JDBC URL above is in the format constructed by Stash when Connecting Stash to SQL Server and will automatically be updated to a URL compatible with Microsoft's driver, with no change required on the administrator's part. If the URL contains additional properties, such as domain=, it will need to be manually updated.

To use Microsoft's SQL Server driver, the settings above would be updated to this:

```
jdbc.driver=com.microsoft.sqlserver.jdbc.SQLServerDriver  
jdbc.url=jdbc:sqlserver://localhost:1433;databaseName=stash;  
jdbc.user=stashuser  
jdbc.password=secretpassword
```

The exact values to use in the new URL are beyond the scope of this documentation; they must be chosen based on the jTDS settings they are replacing.

Additional Information for the curious

The new JDBC driver class is: `com.microsoft.sqlserver.jdbc.SQLServerDriver`

The JDBC URL format for the jTDS driver is documented on SourceForge at <http://jtds.sourceforge.net/faq.html#urlFormat>.

The JDBC URL format for Microsoft's SQL Server driver is documented on MSDN at <http://msdn.microsoft.com/en-us/library/ms378428.aspx>, with documentation for additional properties at <http://msdn.microsoft.com/en-us/library/ms378988.aspx>.

Why change drivers?

[Click here to find all the technical details...](#)

Recent releases of Hibernate, which Stash uses to simplify its persistence layer, have introduced a requirement that the JDBC drivers and connection pools used be JDBC4-compliant. JDBC4 was introduced with Java 6.

The jTDS driver used by releases prior to Stash 2.1 is a JDBC3 driver, compatible with Java 1.3, and therefore cannot be used with newer versions of Hibernate. While jTDS 1.3.0 implements JDBC4, and JDBC4.1 which is provided by Java 7, it *requires* a Java 7 runtime environment. Upgrading Stash to that version was a non-starter, as it would require raising the minimum Java version for the product to Java 7.

Instead, the decision was made to replace jTDS with Microsoft's own SQL Server driver. Microsoft's driver is actively maintained, where jTDS is only recently seeing its first updates in over 3 years, and supports all the features of SQL Server, including SQL Server 2012.

Stash attempts to automatically update jTDS JDBC URLs to values compatible with Microsoft's JDBC driver. However, for installations using custom JDBC URLs—for example, to use domain authentication—such automatic updating is not possible; the URL, which was manually entered, must be manually updated.

Migrating Stash to another server

This page describes how to move your Stash installation from one physical machine to a different machine. For most scenarios, the overall procedure involves the following 4 steps, although your situation may not require all of these:

1. Prepare for the migration.
2. Move the Stash data.
3. Move the Stash installation to the new location, and update `STASH_HOME`.
4. Update the Stash `stash-config.properties` file. This will be necessary if you were unable to use the

Migration Wizard in Step 2.

See also the [Stash upgrade guide](#). You can upgrade Stash either before or after you migrate Stash. This page does not describe any aspect of the upgrade procedure.

On this page:

1. Prepare for the migration
2. Move the Stash data to a different machine
3. Move Stash to a different machine
4. Update the Stash configuration

Related pages:

- [Supported platforms](#)
- [Connecting Stash to an external database](#)
- [Stash upgrade guide](#)

1. Prepare for the migration

In preparation for migrating Stash to another server, check that you have done the following:

- Confirm that the operating system, database, other applicable platforms and hardware on the new machine will comply with the [requirements](#) for Stash.
- Check for any known migration issues in the [Stash Knowledge Base](#).
- Alert users to the forthcoming Stash service outage.
- Ensure that users will not be able to update existing Stash data during the migration. You can do this by temporarily changing the access permissions for Stash.
- Make sure you have [created a user in Stash](#) (not in your external user directory) that has System Administrator [global permissions](#) so as to avoid being locked out of Stash in case the new server does not have access to your external user directory.

2. Move the Stash data to a different machine

This section gives a brief overview of how to move the Stash data to a different machine. You do not need to do anything in this section if you will continue to use the embedded database - the Stash data is moved when you move the Stash installation.

The Stash data includes the data directories (including the Git repositories), log files, installed plugins, temporary files and caches.

You can move the Stash data:

- from the embedded database to a [supported](#) external DBMS.
- to another instance of the same DBMS.
- from one DBMS to another supported DBMS (for example, from MySQL to PostgreSQL).

You can also move the actual DBMS. Atlassian recommends that for large installations, Stash and the DBMS run on separate machines.

There are 2 steps:

1. Create and configure the DBMS in the new location. Please refer to [Connecting Stash to an external database](#), and the relevant child page, for more information.
2. Either:
 - If the new location is currently visible to Stash, use the Stash Database Migration Wizard. Please refer to [Connecting Stash to an external database](#), and the relevant child page, for more information.
 - If the new location is not currently visible to Stash (perhaps because you are moving to a new hosting provider), you need to perform a database export and then import the backup to the new DBMS. Please refer to the vendor documentation for your DBMS for detailed information.
You will also need to update the `stash-config.properties` file in the `<Stash home directory>` as described below.

3. Move Stash to a different machine

This section describes moving the Stash installation to a different machine.

1. Stop Stash. Use `bin\stop-stash.bat` on Windows, or `bin/stop-stash.sh` on Linux and Mac.
2. Make an archive (such as a zip file) of the Stash home directory. The home directory contains data directories (including the Git repositories), log files, installed plugins, temporary files and caches. The home directory location is defined:
 - on Windows, by the `STASH_HOME` environment variable, or by the `STASH_HOME` line of <Stash installation directory>/bin/setenv.bat.
 - on Linux and Mac, by the `STASH_HOME` line of <Stash installation directory>/bin/setenv.sh.
3. Copy the archive to the new machine and unzip it to its new location there.
4. Set up an instance of Stash in the new location by doing one of the following:
 - Make an archive of the old Stash installation directory and copy it across to the new machine.
 - Install the same version of Stash from scratch on the new machine.
5. Redefine the value for `STASH_HOME`, mentioned in Step 2. above, in the new <Stash installation directory>, using the new location for your copied home directory. See [Stash home directory](#) for more information.
6. If you are continuing to use the Stash embedded database, or you used the Migration Wizard to move the Stash data, you should now be able to start Stash on the new machine and have all your data available. Use `bin\start-stash.bat` on Windows, or `bin/start-stash.sh` on Linux and Mac. Once you have confirmed that the new installation of Stash is working correctly, revert the access permissions for Stash to their original values.
7. If you moved the Stash data by performing a database export and import, carry on to Step 4. below to update the `stash-config.properties` file in the <Stash home directory>.

4. Update the Stash configuration

If you moved the Stash data by performing a database export, you must update the `stash-config.properties` file in the <Stash home directory> with the changed configuration parameters for the database connection.

The configuration parameters are described in [Stash config properties](#).

Once the configuration parameters are updated, you should be able to start Stash on the new machine and have all your data available. Use `bin\start-stash.bat` on Windows, or `bin/start-stash.sh` on Linux and Mac. Once you have confirmed that the new installation of Stash is working correctly, revert the access permissions for Stash to their original values.

DRAFT - Migrating Stash to another server

This page...

... describes how to move your Stash installation from one physical machine to a different machine.

If you want to migrate Stash to a different DBMS...

... read [Using the Database Migration Wizard](#) instead.

If you're upgrading Stash...

... read the [Stash upgrade guide](#) too. You can upgrade Stash either before or after you migrate Stash.

For most scenarios, the overall procedure involves the following 4 steps, although your situation may not require all of these:

1. Prepare for the migration.
2. Back up Stash.
3. Restore Stash to the different machine.
4. Update the Stash `stash-config.properties` file.

On this page:

- This page...
- If you want to migrate Stash to a different DBMS...
- If you're upgrading Stash...
 1. Prepare for the migration
 2. Back up Stash
 3. Restore Stash to the different machine
 4. Update the Stash configuration

1. Prepare for the migration

In preparation for migrating Stash to another server, check that you have done the following:

- Confirm that the operating system, database, other applicable platforms and hardware on the new machine will comply with the [requirements](#) for Stash.
- Check for any known migration issues in the [Stash Knowledge Base](#).
- Alert users to the forthcoming Stash service outage.
- Ensure that users will not be able to update existing Stash data during the migration. You can do this by temporarily changing the access permissions for Stash.
- Make sure you have [created a user in Stash](#) (not in your external user directory) that has System Administrator [global permissions](#) so as to avoid being locked out of Stash in case the new server does not have access to your external user directory.

2. Back up Stash

1. Back up Stash. See [Data recovery and backups](#) for detailed information.
2. Stop Stash. See [Starting and stopping Stash](#).

3. Restore Stash to the different machine

If you want Stash to use the same DB as before, refer to...

If you want Stash to connect to a new DB instance, refer to...

See [Data recovery and backups](#) for detailed information.

1. Set up an instance of the same version of Stash on the new machine by doing one of the following:
 - Install Stash using the Stash installer, if available for your version. See [Running the Stash installer](#). At the 'Select Stash Home' step, browse to the newly restored Stash home directory (as defined by the STASH_HOME variable – see [Stash home directory](#)).
 - Either install Stash manually from a downloaded archive file (see [Install Stash from an archive file](#)), or make an archive of the old Stash installation directory and copy it across to the new machine. In either case, you'll need to redefine the value for STASH_HOME, using the new location of your copied home directory. See [Stash home directory](#) for more information.
2. If you are continuing to use the Stash embedded database, you should now be able to [start Stash](#) on the new machine and have all your data available. Once you have confirmed that the new installation of Stash is working correctly, revert the access permissions for Stash to their original values.
3. If you moved the Stash data by performing a database export and import, carry on to Step 4 below to update the stash-config.properties file in the <Stash home directory>.

4. Update the Stash configuration

If you moved the Stash data by performing a database export, you must update the stash-config.properties file in the <Stash home directory> with the changed configuration parameters for the database connection.

The configuration parameters are described in [Stash config properties](#).

Once the configuration parameters are updated, you should be able to start Stash on the new machine and have all your data available. Use bin\start-stash.bat on Windows, or bin/start-stash.sh on

Linux and Mac.

Once you have confirmed that the new installation of Stash is working correctly, revert the access permissions for Stash to their original values.

Specifying the base URL for Stash

This is the base URL for this installation of Stash. All links *which are not from a web request* (for example in Stash email notifications), will be prefixed by this URL. If you are experiencing trouble with setting an `https` base URL, please ensure you have configured [Tomcat with SSL](#) correctly.

To specify Stash's base URL:

1. In the Stash administration area, click **Server settings** (under 'Settings').
2. In the **Base URL** field, type the URL address of your Stash server (for example, "`https://stash.mycompany.com`").
3. Click **Save**.

Configuring the application navigator

The application navigator, on the left of the Stash header, allows you to switch to your other applications, such as Atlassian JIRA and Bamboo – or any other web application – all from the Stash header:

The screenshot shows the Stash application header with a navigation bar containing 'Projects' and 'Repositories'. On the left, there is a sidebar titled 'Atlassian JIRA' which lists several links: 'Stash Prod', 'Stash Dev' (with a bullet point next to it), 'Bamboo', and a 'Configure...' button. To the right of this sidebar, there is a search bar with the placeholder 'project' and a 'Key' column header. Below the sidebar, there is a user icon labeled 'Angry Nerds' and the identifier 'AN'.

Users only see the application navigator when links are set up – if there are no links, only administrators can see it.

Stash administrators can configure which apps appear in the navigator – just click **Configure** in the application navigator, or go to the Stash admin area and click **Application Navigator**:

- **Linked applications** are automatically configured in the application navigator, and can't be deleted. Click **Manage** to configure those in the source application.
- Specify new links, as required by your users, by entering a **Name** and **URL**.
- Restrict the visibility of links to particular user groups, or hide the link completely. Click in a row, under the **Groups** column header, to edit those properties for existing rows.
- Use the 'handles' at the left to change the link order when seen in Stash.

| Name | URL | Hide | Restricted to Groups | |
|-----------------|---|--------------------------|------------------------|---------------------------------------|
| | | <input type="checkbox"/> | | <input type="button" value="Add"/> |
| Atlassian JIRA | https://jira.atlassian.com/ | | Manage | |
| Stash Prod | https://stash.atlassian.com | | | <input type="button" value="Delete"/> |
| Stash Dev | https://stash.dev.internal.atlassian.com/ | | | |
| extranet-bamboo | https://extranet-bamboo.internal.atlassian.com/ | | Manage | |

Managing add-ons

An add-on is an installable component that supplements or enhances the functionality of Stash in some way. For example, the [Custom Navigation Plugin](#) enables you to configure custom navigation tabs specific to a repository. Other add-ons are available for adding graphs to Stash, importing SVN source control projects into Stash, and accessing Atlassian support from Stash.

Stash comes with many pre-installed add-ons (called system add-ons). You can install more add-ons, either by acquiring the add-on from the [Atlassian Marketplace](#) or by uploading it from your file system. This means that you can install add-ons that you have developed yourself. For information about developing your own add-ons for Stash, see the [Stash Developer Documentation](#).

On this page:

- [About the Universal Plugin Manager \(UPM\)](#)
- [Administering add-ons in Stash](#)

About the Universal Plugin Manager (UPM)

You administer add-ons for Stash using the Universal Plugin Manager (UPM). The UPM is itself an add-on that exposes add-on administration pages in the Stash Administration Console. UPM works across Atlassian applications, providing a consistent interface for administering add-ons in Stash, Crucible, Confluence, FishEye, JIRA and Bamboo.

UPM comes pre-installed in recent versions of all Atlassian applications, so you do not normally need to install it yourself. However, like other add-ons, the UPM software is subject to regular software updates. Before administering add-ons in Stash, therefore, you should [verify your version](#) of the UPM and update it if needed.

Administering add-ons in Stash

You can update UPM, or any add-on, from the UPM's own add-on administration pages. Additionally, you can perform these tasks from the UPM administration pages:

- Install or remove add-ons
- Configure add-on settings
- Discover and install new add-ons from the [Atlassian Marketplace](#)
- Enable or disable add-ons and their component modules

It shows only those plugins that are supported in your version of the product, so that you do not install incompatible plugins.

If the add-on request feature is enabled in your Atlassian application, non-administrative users can also discover add-ons on the Atlassian Marketplace. Instead of installing the add-ons, however, these users have the option of requesting the add-ons from you, the administrator of the Atlassian application.

For more information on administering the add-on request feature or performing other common add-on administration tasks, see the [Universal Plugin Manager documentation](#). For an end-user's view of requesting add-ons in Stash, see [Requesting add-ons](#).

POST service webhook for Stash

Repository administrators can add a POST service to a repository. Stash POSTs to the service URL you specify.

You can use an URL with the following format:

```
https://server:port/path/
```

The service receives a POST whenever the user pushes to the repository.

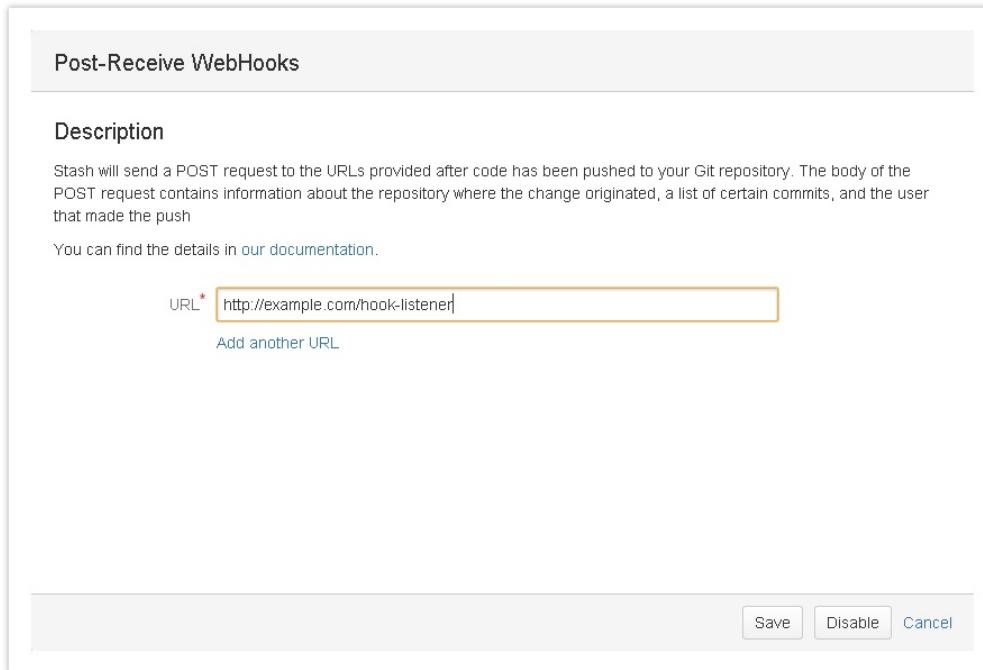

The content type header of the POST has an application/json type. The content is a JSON payload that represents the repository push.

Setting up the POST service

You can either set up the POST service manually or you can write a service to automate this. You would write a service if you are integrating an application with Stash.

Set up in the repository settings

1. Go to the repository's settings.
2. Click **Hooks** in the left-hand navigation.
3. Click **Enable** for the 'Post-Receive Webhooks' item. You can add up to 5 URLs for where Stash should send its update messages:

4. Press **Save**.

POST data

When a user pushes to a repository, Stash POSTs to the URL you provided. The body of the POST request contains information about the repository where the change originated, a list of recent commits, and the name of the user that made the push.

Example of payload

This is an example of a push that contains one commit that changes 2 files (*pom.xml*) in folders *iridium-common* and *iridium-magma*.

JSON Payload

```
{  
    "repository": {  
        "slug": "iridium-parent",

Properties

Some of the system-wide properties for the Webhook Plugin can be overridden in the Stash configuration file. The available properties are listed in [Stash config properties](#).

Audit logging in Stash

Stash comes with an internal audit system enabled by default at installation. The audit system is intended to give administrators an insight into the way Stash is being used. The audit system could be used to identify authorized and unauthorized changes, or suspicious activity over a period of time.

Viewing recent events

Stash administrators and system administrators can see a list of recent events for each project and repository in the 'Audit log' view. This is found in the 'Settings' for a project or repository, and shows only the most important audit events.

Settings

| | Audit log | | |
|--------------------|------------------|-----------------------------|---|
| | User | Action | Details |
| | | | Time |
| Repository details | Paul Watson | RepositoryHookEnabledEvent | {"project":"STASH","repository":"stash","hook":"com.atlassian.stash.plugin.stash-web-post-receive-hooks-plugin:postReceiveHook"} |
| Hooks | Charles O'Far... | RepositoryHookEnabledEvent | {"project":"STASH","repository":"stash","hook":"com.atlassian.stash.plugin.stash-release-management-hook-plugin:releaseManagementHook"} |
| Pull requests | Charles O'Far... | RepositoryHookDisabledEvent | {"project":"STASH","repository":"stash","hook":"com.atlassian.stash.plugin.stash-release-management-hook-plugin:releaseManagementHook"} |
| Branching model | Juan Palacios | RepositoryHookEnabledEvent | {"project":"STASH","repository":"stash","hook":"com.atlassian.stash.plugin.stash-release-management-hook-plugin:releaseManagementHook"} |
| Audit log | Charles O'Far... | RepositoryHookEnabledEvent | {"project":"STASH","repository":"stash","hook":"com.atlassian.stash.plugin.stash-bundled-hooks:force-push-hook"} |
| Access keys | | | 2 days ago |
| PERMISSIONS | | | 2 days ago |
| Repository | | | Yesterday |
| Branch | | | Yesterday |
| ADD-ONS | | | |
| Git operations | | | |
| Branches and tags | | | |

The audit log displays a subset of the events recorded in the log file and is kept to a configurable maximum size (the default is 500 events). See [Audit events in Stash](#) for more details.

Accessing the audit log file

The full audit log file records a wide range of events in Stash. See [Audit events in Stash](#) for a list of these. The volume of events that are logged is coarsely configurable by changing a Stash server setting. See [Stash config properties](#) for more details.

You can find the log file in the <[Stash home directory](#)>/log/audit directory.

The log file will roll daily and also when it grows past a maximum size of 25 MB. There is a limit (currently 100) to the number of rolled files that Stash will keep. When the limit is reached, the oldest file is deleted each day.

⚠ Note that you will need to back up the log files before they are removed, if your organisation needs to keep copies of those.

Configuring audit logging

There are [various system properties](#) that can be used to configure audit logging in Stash.

Audit events in Stash

The auditing component of Stash will log many different events that occur when Stash is being used. The events have been assigned priorities based on how important they are – these priorities can be used to

control how much information is added to the audit log file. For example, if you have a server under high load and no need for auditing, you may wish to turn audit logging off by setting it to `NONE` – see the [audit log config properties](#).

On this page:

- Server level events
- User management events
- Permission events
- Project events
- Repository events
- Pull request events
- Plugin events
- SSH key events

Server level events

| Event | Description | Priority |
|--------------------------------------|---|----------|
| ApplicationConfigurationChangedEvent | The server configuration has changed e.g. the display name or the base url . | HIGH |
| BackupEvent | Audited at the beginning and the end of a system backup . | HIGH |
| LicenseChangedEvent | The server license has changed. | HIGH |
| MailHostConfigurationChangedEvent | The servers mail host has changed (used to send email notifications). | HIGH |
| MigrationEvent | Audited at the beginning and the end of a database migration . | HIGH |
| ServerEmailAddressChangedEvent | The server email address has changed (used in email notifications). | HIGH |
| TicketRejectedEvent | Certain resources (e.g. the Git processes) are throttled, when tickets are rejected (e.g. too many Git processes are in use) this event is fired. | LOW |

User management events

| Event | Description | Priority |
|-----------------------|---|----------|
| DirectoryCreatedEvent | Occurs when a new directory is created. | HIGH |
| DirectoryDeletedEvent | Occurs when a new directory is deleted. | HIGH |
| GroupCreatedEvent | Occurs when a new group is created in the internal directory. | HIGH |
| GroupUpdatedEvent | Occurs when a new group is updated (not when membership changes) in the internal directory. | HIGH |
| GroupDeletedEvent | Occurs when a new group is deleted from the internal directory. | HIGH |

| | | |
|--|---|--------|
| GroupMembershipCreatedEvent | Occurs when a user is added to a group in the internal directory. | HIGH |
| GroupMembershipDeletedEvent | Occurs when a user is removed from a group in the internal directory. | HIGH |
| UserAuthenticatedEvent | Occurs when a user is successfully authenticated (logged in). | LOW |
| UserAuthenticationFailedInvalidAuthenticationEvent | Occurs whenever a user fails to authenticate.

Note that this can occur frequently in Stash whenever a command line CLI is used as the initial URL provided to Stash contains a username but no password, which is rejected by Crowd. | MEDIUM |
| UserCreatedEvent | Occurs when a user is created in the internal directory. | HIGH |
| UserCredentialUpdatedEvent | Occurs when a user changes password in the internal directory. | HIGH |
| UserDeletedEvent | Occurs when a user is deleted from the internal directory. | HIGH |
| UserRenamedEvent | Occurs when the username of a user is changed in the internal directory. | HIGH |

Permission events

 in the table below indicates that the event is visible in the recent audit log screen for the project or repository.

| Event | Description | Priority |
|-------------------------------|---|----------|
| GlobalPermissionGrantedEvent | Occurs when a user or group is granted a global permission (e.g. create project). | HIGH |
| GlobalPermissionRevokedEvent | Occurs when a user or group has a global permission revoked. | HIGH |
| ProjectPermissionGrantedEvent | Occurs when a user or group is granted a permission for a specific project.  | HIGH |
| ProjectPermissionRevokedEvent | Occurs when a user or group has a permission for a specific project revoked.  | HIGH |
| RepositoryPermissionEvent | Occurs when a user or group has a permission for a specific repository altered.  | HIGH |
| RestrictedRefEvent | Children of this event are fired when a restricted ref is altered.  | HIGH |

Project events

 in the table below indicates that the event is visible in the recent audit log screen for the project.

| Event | Description | Priority |
|-----------------------------------|--|----------|
| ProjectAvatarUpdatedEvent | Raised when a project avatar has been successfully updated. | LOW |
| ProjectCreatedEvent | Raised when a project is created.  | HIGH |
| ProjectCreationRequestedEvent | Raised just before a project is created; can be cancelled. | LOW |
| ProjectModifiedEvent | Raised when a project has been successfully updated (e.g. the project name).  | HIGH |
| ProjectModificationRequestedEvent | Raised just before a project is updated; can be cancelled. | LOW |
| ProjectDeletedEvent | Raised when a project is deleted. | HIGH |
| ProjectDeletionRequestedEvent | Raised just before a project is deleted; can be cancelled. | LOW |

Repository events

 in the table below indicates that the event is visible in the recent audit log screen for the project or repository.

| Event | Description | Priority |
|--------------------------------------|---|----------|
| RepositoryAccessedEvent | Raised when a repository is accessed by a user. Stash currently only fires this event selectively - when users hit a repository page. | LOW |
| RepositoryCreatedEvent | Raised when a repository is created.  | MEDIUM |
| RepositoryCreationFailedEvent | Raised when an attempt to create a repository fails. | LOW |
| RepositoryCreationRequestedEvent | Raised just before a repository is created; can be cancelled. | LOW |
| RepositoryForkedEvent | Raised when a repository is forked successfully.  | MEDIUM |
| RepositoryForkFailedEvent | Raised when an attempt to fork a repository fails. | LOW |
| RepositoryForkRequestedEvent | Raised just before a repository is forked; can be cancelled. | LOW |
| RepositoryDefaultBranchModifiedEvent | Raised when the default branch of a repository is reconfigured (typically through repository settings). | LOW |
| RepositoryDeletedEvent | Raised when a repository is deleted.  | HIGH |
| RepositoryDeletionRequestedEvent | Raised just before a repository is deleted; can be cancelled. | LOW |
| RepositoryOtherReadEvent | Raised when the server uploads a pack file to the client via HTTP. | LOW |

| | | |
|---------------------------|---|-----|
| RepositoryOtherWriteEvent | Raised when the server receives a pack file from the client via HTTP. | LOW |
| RepositoryPullEvent | Raised when a Git client pulls from a repository (only when new content is sent to the client). | LOW |
| RepositoryPushEvent | Raised when a Git client pushed to a repository. | LOW |

Pull request events

| Event | Description | Priority |
|------------------|---|----------|
| PullRequestEvent | Fired at different points in the pull request lifecycle (declined, merged, opened, reopened, rescoped [code updated], updated, approved, unapproved, participants updated). | LOW |

Plugin events

See this [plugin documentation](#) for details of when these events below are triggered.

| Event | Description | Priority |
|---------------------------------|---|----------|
| PluginDisabledEvent | Occurs when a plugin has been disabled, either by the system or a user. | MEDIUM |
| PluginEnabledEvent | Occurs when a plugin has been enabled, either by the system or a user. | MEDIUM |
| PluginModuleDisabledEvent | Occurs when a plugin module has been disabled, either by the system or a user. | MEDIUM |
| PluginModuleEnabledEvent | Occurs when a plugin module has been enabled, either by the system or a user. | MEDIUM |
| PluginModuleUnavailableEvent | Signifies a plugin module is now unavailable outside the usual installation process. | MEDIUM |
| PluginUninstalledEvent | Occurs when a plugin is explicitly uninstalled (as opposed to as part of an upgrade). | MEDIUM |
| PluginUpgradedEvent | Signifies that a plugin has been upgraded at runtime. | MEDIUM |
| PluginContainerUnavailableEvent | Occurs when the container of a plugin is being shutdown, usually as a result of the server being stopped. | LOW |
| PluginModuleAvailableEvent | Signifies that a plugin module is now available outside the usual installation process. | LOW |
| PluginFrameworkStartedEvent | Signifies that the plugin framework has been started and initialized. | LOW |

SSH key events

 in the table below indicates that the event is visible in the recent audit log screen for the project or repository.

| Event | Description | Priority |
|-------|-------------|----------|
| | | |

| | | |
|--------------------------|---|------|
| SshKeyCreatedEvent | Occurs when: <ul style="list-style-type: none"> an SSH key is added for a user, or an access key is added to a project or repository and the key has not yet been used on any other projects or repositories. | HIGH |
| SshKeyDeletedEvent | Occurs when: <ul style="list-style-type: none"> an SSH key is removed from a user, or an access key is removed from a project or repository and it is no longer being used by any other projects or repositories. | HIGH |
| SshKeyAccessGrantedEvent | Occurs when an access key is given access to a project or repository. i | HIGH |
| SshKeyAccessRevokedEvent | Occurs when an access key is removed from a project or repository. i | HIGH |

Advanced actions

This section describes the administrative actions that can be performed from outside of the Stash Administration user interface.

In this section:

- [Running the Stash installer](#)
- [Starting and stopping Stash](#)
- [Install Stash from an archive file](#)
- [Running Stash as a Linux service](#)

Running the Stash installer

This page provides information about aspects of running the Stash installer. For high-level information about installing and using Stash see [Getting started](#).

The installer will:

- install Stash into a fresh directory (note that installer does not perform an in-place upgrade).
- install a supported version of the Java JRE, which is only available to Stash, if necessary.
- launch Stash when it finishes.

Install Stash as a service

On Linux and Windows systems, the installer can install Stash as a service.

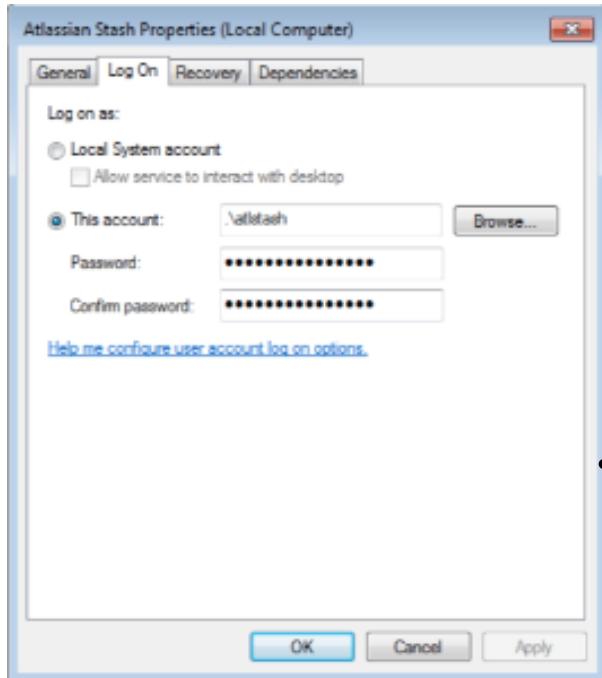

A service account named 'atlstash' will be created.

On Linux:

- The 'atlstash' account will be a locked account (it cannot be used to log in to the system).
- The `init.d` script will be linked to run levels 2, 3, 4 and 5. If you wish to change this, you will need to configure it **manually**.

Windows:

- The installer generates a password for the service account. As a Windows administrator, you can update the account password if you wish to own the account. You'll also need to update the log on credentials for the service:

- The 'atlstash' account will be configured with `SeServiceLogonRight` so that it can be used by the service. It will also be configured with `SeDenyBatchLogonRight`, `SeDenyInteractiveLogonRight`, `SeDenyNetworkLogonRight`, and `SeDenyRemoteInteractiveLogonRight` so that it cannot be used to log into the machine.
- For Windows services created using the Stash installer, the [Stash home directory](#) location (defined by the `STASH_HOME` variable) is configured as a Tomcat Service JVM option. To change it see [Change STASH_HOME when installed as a Windows service](#).

Console and unattended mode

The Stash installer has three modes:

- GUI mode: the default mode for the installer is to display a GUI installer.
- Console mode: if the installer is invoked with the `-c` argument, the interaction with the user is performed in the terminal from which the installer was invoked.
- Unattended mode: if the installer is invoked with the `-q` argument, there is no interaction with the user and the installation is performed automatically with the default values.

Unattended mode also allows you to supply a response file with a `-varfile` option, to supply answers for all questions that are used instead of the defaults. An example response file is:

Example response file

```
// Should Stash be installed as a Service? Must be ADMIN (default: true if the
process is running with administrator rights, false otherwise). If false, the home
and installation directories must be specified to point to directories owned by the
user
app.install.service$Boolean=true

// The ports Stash should bind to (defaults: portChoice=default, httpPort=7990,
serverPort=8006)
portChoice=custom
httpPort=7990
serverPort=8006

// Path to the Stash HOME directory (default: /var/atlassian/application-data/stash
if the process is running with administrator rights,
~/atlassian/application-data/stash otherwise)
app.stashHome=/var/atlassian/application-data/stash

// The target installation directory (default: /opt/atlassian/stash/<VERSION> if
the process is running with administrator rights, ~/atlassian/stash/<VERSION>
otherwise)
sys.installationDir=/opt/atlassian/stash/<VERSION>
```

For more information see [this install4j help page](#).

Starting and stopping Stash

There are a few ways that you can start and stop Stash:

- At install time
- When Stash runs as a service
- Manually

At install time

The Stash installer automatically starts Stash.

On Windows and Linux systems you can choose to have Stash installed as a service.

When Stash runs as a service

If Stash is installed as a service on Windows and Linux systems, it will be started automatically when the system boots, of course. The Stash service can also be started and stopped from the admin console, on Windows.

On Mac OS X, you will need to restart Stash manually, as described below.

Manually

You can start and stop Stash manually as follows:

Windows

Start and stop Stash using the **Stash** items in the Windows Start menu. Use the URL item there to visit Stash in your default browser.

Alternatively, start Stash from a command prompt, by changing directory to the <Stash installation directory> and running the following command:

```
bin\start-stash.bat
```

Stop Stash manually by changing directory to the <Stash installation directory> and running the following command:

```
bin\stop-stash.bat
```

Linux

Start and stop Stash manually using the scripts provided.

Start Stash by changing directory in a terminal to the <Stash installation directory> and running:

```
bin/start-stash.sh
```

Stop Stash by changing directory in a terminal to the <Stash installation directory> and running:

```
bin/stop-stash.sh
```

Mac

Start and stop Stash manually using the app icons (shown above) in the <Stash installation directory>. These simply link to the `start-stash.sh` and `stop-stash.sh` scripts in <Stash installation directory>/bin.

Use the URL icon to visit Stash in your default browser.

Install Stash from an archive file

This page...

... describes how to manually install Stash on Linux, Mac OS X and Windows.

Use the installer instead...

... for a quick and troublefree install.
See [Getting started](#).

For production installs...

... we highly recommend that you first read [Using Stash in the enterprise](#).

This page describes how to manually install Stash from an archive file. However, we strongly recommend that you use the Stash installer instead, for a quick and troublefree install experience.

See also:

- [Chef recipe for Stash](#)
- [Puppet/Vagrant How-To](#)

1. Check supported platforms

Check the [Supported platforms](#) page for details of the application servers, databases, operating systems, web browsers and Java and Git versions that we have tested Stash with and recommend.

Atlassian only officially supports Stash running on x86 hardware and 64-bit derivatives of x86 hardware.

Cygwin Git is *not supported*. No internal testing is done on that platform, and many aspects of Stash's functionality (pull requests and forks among them) have known issues. When running Stash on Windows, *always* use msysGit.

2. Check your version of Java

In a terminal or command prompt, run this:

```
java -version
```

The version of Java should be **1.7.x** or **1.8.x**. You'll need a 64-bit version of Java if you have a 64-bit operating system.

▼ [On Linux, if you don't see a supported version, then get Java...](#)

Install Java

Download Java Server JRE from [Oracle's website](#), and install it.

Now try running 'java -version' again to check the installation. The version of Java should be **1.7.x** or **1.8.x**.

Check that the system can find Java

In a terminal, run this:

```
echo $JAVA_HOME
```

You should see a path like `/usr/jdk/jdk1.7.0`.

If you don't see a path, then set JAVA_HOME

Do one of the following:

- If `JAVA_HOME` is not set, log in with 'root' level permissions and run:

```
echo JAVA_HOME="path/to/JAVA_HOME" >> /etc/environment
```

where `path/to/JAVA_HOME` may be like: `/usr/jdk/jdk1.7.0`

- If `JAVA_HOME` needs to be changed, open the `/etc/environment` file in a text editor and modify the value for `JAVA_HOME` to:

```
JAVA_HOME="path/to/JAVA_HOME"
```

It should look like: `/usr/jdk/jdk1.7.0`

▼ [On Mac OS X, if you don't see a supported version, then get Java...](#)

Install Java

Download Java Server JRE from [Oracle's website](#), and install it.

Now try running 'java -version' again to check the installation. The version of Java should be **1.7.x** or **1.8.x**.

Check that the system can find Java

In a terminal, run this:

```
echo $JAVA_HOME
```

You should see a path like /System/Library/Frameworks/JavaVM.framework/Versions/CurrentJDK/Home/.

If you don't see a path, then set JAVA_HOME

Open your ~/.profile file in a text editor and insert:

```
JAVA_HOME="path/to/JAVA_HOME"  
export JAVA_HOME
```

where path/to/JAVA_HOME may be like: /System/Library/Frameworks/JavaVM.framework/Versions/CurrentJDK/Home/

Refresh your ~/.profile in the terminal and confirm that JAVA_HOME is set:

```
source ~/.profile  
$JAVA_HOME/bin/java -version
```

You should see a version of Java that is **1.7.x** or **1.8.x**, like this:

```
java version "1.7.0_1"
```

On Windows, if you don't see a supported version, then get Java...

Install Java

Download Java Server JRE from [Oracle's website](#), and install it.

Now try running 'java -version' again to check the installation. The version of Java should be **1.7.x** or **1.8.x**.

Check that the system can find Java

Stash uses the JAVA_HOME environment variable to find Java. To check that, in a command prompt, run:

```
echo %JAVA_HOME%
```

You should see a path to the root directory of the Java installation. When running Stash on Windows, unlike Linux or Unix, JAVA_HOME paths with spaces are just fine.

If you don't see a path, then set JAVA_HOME

▼ Windows 7 ...

Stage 1. Locate the JRE installation directory

If you already know the installation path for the Java Runtime Environment, go to *Stage 2* below. Otherwise, find the installation path by following these instructions:

1. If you didn't change the installation path for the Java Runtime Environment during installation, it will be in a directory under C:\Program Files\Java. Using Explorer, open the directory C:\Program Files\Java.
2. Inside that path will be one or more subdirectories such as C:\Program Files\Java\jre7.

Stage 2. Set the JAVA_HOME variable

1. Go to **Start**, search for "sys env" and choose **Edit the system environment variables**.
2. Click **Environment Variables**, and then **New** under 'System variables'.
3. Enter "JAVA_HOME" as the **Variable name**, and the absolute path to where you installed Java as the **Variable value**. Don't use a trailing backslash, and don't wrap the value in quotes.

Now, in a *new command prompt*, try running '%JAVA_HOME%\bin\java -version'. You should see the same version of Java as you saw in 2. above.

▼ Windows Server 2003 R2 ...

Stage 1. Locate the JRE installation directory

If you already know the installation path for the Java Runtime Environment, go to *Stage 2* below. Otherwise, find the installation path by following these instructions:

1. If you didn't change the installation path for the Java Runtime Environment during installation, it will be in a directory under C:\Program Files\Java. Using Explorer, open the directory C:\Program Files\Java.
2. Inside that path will be one or more subdirectories such as C:\Program Files\Java\jre7.

Stage 2. Set the JAVA_HOME variable

Once you have identified the JRE installation path:

1. Right-click the **My Computer** icon on your desktop and select **Properties**.
2. Click the **Advanced** tab.
3. Click the **Environment Variables** button.
4. Under **System Variables**, click **New**.
5. Enter the **variable name** as **JAVA_HOME**.
6. Enter the **variable value** as the installation path for the Java Development Kit. Don't use a trailing backslash, and don't wrap the value in quotes.
 - If your Java installation directory has a space in its path name, you should use the shortened path name (e.g. C:\Progra~1\Java\jre7) in the environment variable instead.

Note for Windows users on 64-bit systems

Progra~1 = 'Program Files'
Progra~2 = 'Program Files(x86)'

7. Click **OK**.
8. Click **Apply Changes**.
9. Close any command window which was open before you made these changes, and open a new command window. There is no way to reload environment variables from an active command prompt. If the changes do not take effect even after reopening the command window, restart Windows.

Now, in a *new command prompt*, try running '%JAVA_HOME%\bin\java -version'. You should see the same version of Java as you saw in 2. above.

3. Check your versions of Git and Perl

In a terminal or command prompt, run:

```
git --version
perl --version
```

The version of Git should be **1.7.6** or higher. The version of Perl should be **5.8.8** or higher.

If you don't see supported versions of Git and Perl, either install or upgrade them – see [Installing and upgrading Git](#).

4. Now it's time to get Stash

Download Stash from the Atlassian download site. Looking for the Stash WAR file?

[Download latest version](#) ➔

Extract the downloaded file to an install location. The path to the extracted directory is referred to as the <stash installation directory> in these instructions.

Note that you should use the same user account to both extract Stash and to run Stash (in Step 6.) to avoid possible permission issues at startup. For production installations, we recommend that you create a new dedicated user that will run Stash on your system. See [Running Stash with a dedicated user](#).

5. Tell Stash where to store your data

The Stash [home directory](#) is where your Stash data is stored.

If you are upgrading Stash, simply update the value of STASH_HOME in the <Stash installation directory>/bin/setenv file so the *new* Stash installation points to your *existing* Stash [home directory](#) (if you use a STASH_HOME environment variable to specify the home directory location, no change is required).

Otherwise, for a new install, create your Stash home directory (without spaces in the name), and then tell Stash where you created it by editing the <Stash installation directory>/bin/setenv file – uncomment the STASH_HOME line and add the absolute path to your home directory. Here's an example of what that could look like when you're done:

```

1  #
2  # One way to set the STASH HOME path is here via this variable. Simply uncomment it and set a valid path
3  # /stash/home. You can of course set it outside in the command terminal; that will also work.
4  #
5  STASH_HOME="/Users/spittet/stash-home"
6  #
7  #
8  # Occasionally Atlassian Support may recommend that you set some specific JVM arguments. You can use the
9  # below to do that.
10 #

```

⚠ You should not locate your Stash home directory inside the <stash installation directory> — they should be entirely separate locations. If you do put the home directory in the <Stash installation directory> it will be overwritten, and lost, when Stash gets upgraded. And by the way, you'll need separate Stash home directories if you want to run multiple instances of Stash.

▼ [Click here for Windows notes...](#)

Tell Stash where you created it by setting a STASH_HOME environment variable, for Windows 7, as follows:

1. Go to **Start**, search for "sys env" and choose **Edit the system environment variables**.
2. Click **Environment Variables**, and then **New** under 'System variables'.
3. Enter "STASH_HOME" as the **Variable name**, and the absolute path to your Stash home directory as the **Variable value**. Don't use a trailing backslash.

There are a few things to know about setting up the Stash home directory on Windows that will make life easier:

- Keep the path length to the Stash home directory as short as possible. See [Pull request merges can fail when Stash is hosted on Windows](#) for an explanation.
- Don't use spaces in the path to the Stash home directory.

6. Start Stash!

There are a couple of ways in which you can start Stash – see [Starting and stopping Stash](#).

Now, in your browser, go to <http://localhost:7990> and run through the Setup Wizard. In the Setup Wizard:

- Select **Internal** at the 'Database' step, if you are evaluating Stash. Stash will happily use its internal database, and you can easily migrate to external database later. See [Connecting Stash to an external database](#).
- Enter your Stash license key.
- Set the base URL for Stash.
- Set up an administrator account.
- You can set up JIRA integration, but you can do this later if you wish. See [Configuring JIRA integration in the Setup Wizard](#).

7. Set up your mail server

Configure your email server so users can receive a link from Stash that lets them generate their own passwords. See [Setting up your mail server](#).

8. Add users and repositories

Now is the time to set up your users in Stash, and to tell Stash about any existing repositories you have. Please the following pages for the details:

- [Getting started with Git and Stash](#)
- [Importing code from an existing project](#)

Additional steps for production environments

For production or enterprise environments we recommend that you configure the additional aspects described on [Using Stash in the enterprise](#). The aspects described there are not necessary when you are installing for evaluation purposes only.

If you wish to install Stash as a service on Linux or Windows, see either of:

- [Running Stash as a Linux service](#)
- [Running Stash as a Windows service](#)

Stopping Stash (optional)

See [Starting and stopping Stash](#).

Uninstalling Stash

To uninstall Stash, stop Stash as described above and then delete the <Stash installation directory> and [Stash home directory](#).

Running Stash as a Linux service

- The Stash installer for Linux installs Stash as a service – see [Getting started](#). The information on this page only applies if you are manually installing or upgrading Stash.
- System administration tasks are [not supported by Atlassian](#). These instructions are only provided as a guide and may not be up to date with the latest version of your operating system.

For production use on a Linux server, Stash should be configured to run as a Linux service, that is, as a daemon process. This has the following advantages:

- Stash can be automatically restarted when the operating system restarts.
- Stash can be automatically restarted if it stops for some reason.
- Stash is less likely to be accidentally shut down, as can happen if the terminal Stash was manually started in is closed.
- Logs from the Stash JVM can be properly managed by the service.

This page describes the following approaches to running Stash as a service on Linux:

- Use the [Java Service Wrapper](#), which allows a Java application to be run as a UNIX daemon.
- Use an [init.d script](#) to start Stash at boot time - this doesn't restart Stash if it stops for some reason.
- Use a [systemctl script](#) to start Stash at boot time - this doesn't restart Stash if it stops for some reason.

Note that Stash assumes that the external database is available when it starts; these approaches do not support service dependencies, and the startup scripts will not wait for the external database to become available.

On this page:

- [Using the Java Service Wrapper](#)
- [Using an init.d script](#)
- [Running on system boot](#)
- [Using a systemctl script on Fedora](#)

Related pages:

- [Install Stash from an archive file](#)

Using the Java Service Wrapper

Stash can be run as a service on Linux using the [Java Service Wrapper](#). The Service Wrapper is known to work with Debian, Ubuntu, and Red Hat.

The Service Wrapper provides the following benefits:

- Allows Stash, which is a Java application, to be run as a service.
- No need for a user to be logged on to the system at all times, or for a command prompt to be open and running on the desktop to be able to run Stash.
- The ability to run Stash in the background as a service, for improved convenience, system performance and security.
- Stash is launched automatically on system startup and does not require that a user be logged in.
- Users are not able to stop, start, or otherwise tamper with Stash unless they are an administrator.
- Can provide advanced failover, error recovery, and analysis features to make sure that Stash has the maximum possible uptime.

Please see <http://wrapper.tanukisoftware.com/doc/english/launch-nix.html> for wrapper installation and configuration instructions.

The service wrapper supports the standard commands for SysV init scripts, so it should work if you just create a symlink to it from /etc/init.d.

Using an init.d script

The usual way on Linux to ensure that a process restarts at system restart is to use an init.d script. This approach does not restart Stash if it stops by itself.

1. Stop Stash.
2. Create a stash user, set the permissions to that user, create a home directory for Stash and create a symlink to make upgrades easier:

```
$> curl -OL
http://downloads.atlassian.com/software/stash/downloads/atlassian-stash-2.0.1.tar.gz
$> tar xz -C /opt -f atlassian-stash-2.0.1.tar.gz
$> ln -s /opt/atlassian-stash-2.0.1 /opt/atlassian-stash-latest

# Create a home directory
$> mkdir /opt/stash-home

# ! Update permissions and ownership accordingly
```

3. Create the startup script in /etc/init.d/stash with the following contents (Ensure the script is executable by running chmod 755 stash):

```
#!/bin/sh

### BEGIN INIT INFO
# Provides:          stash
# Required-Start:    $remote_fs $syslog
# Required-Stop:     $remote_fs $syslog
# Default-Start:    2 3 4 5
# Default-Stop:      0 1 6
# Short-Description: Initscript for Atlassian Stash
# Description:       Automatically start Atlassian Stash when the system starts up.
```

```
#           Provide commands for manually starting and stopping Stash.
### END INIT INFO

# Adapt the following lines to your configuration
# RUNUSER: The user to run Stash as.
RUNUSER=vagrant

# STASH_INSTALLDIR: The path to the Stash installation directory
STASH_INSTALLDIR="/opt/atlassian-stash-2.0.1"

# STASH_HOME: Path to the Stash home directory
STASH_HOME="/opt/stash-home"

#

    echo "Usage: $SCRIPTNAME {start|stop|status|restart|force-reload}" >&2
    ;;
*)
```

```

    exit 3
    ;
esac

```

Running on system boot

1. To start on system boot, add the script to the start up process.

For Ubuntu (and other Debian derivatives) use:

```
update-rc.d stash defaults
```

For RHEL (and derivatives) use:

```
chkconfig --add stash --level 0356
```

Note: You may have to install the redhat-lsb package on RHEL (or derivatives) to provide the LSB functions used in the script.

2. Verify that the Stash service comes back up after restarting the machine.

Using a systemctl script on Fedora

Thanks to [Patrick Nelson](#) for calling out this approach, which he set up for a Fedora system. This approach does not restart Stash if it stops by itself.

1. Create a `stash.service` file in your `/usr/lib/systemd/system/` directory with the following lines:

```

[Unit]
Description=Atlassian Stash Service
After=syslog.target network.target

[Service]
Type=forking
ExecStart=/opt/atlassian-stash-2.5.0/bin/start-stash.sh
ExecStop=/opt/atlassian-stash-2.5.0/bin/stop-stash.sh

[Install]
WantedBy=multi-user.target

```

The values for `ExecStart` and `ExecStop` should be adjusted to match the path to your <Stash installation directory>.

2. Enable the service to start at boot time by running the following in a terminal:

```
systemctl enable stash.service
```

3. Stop Stash, then restart the system, to check that Stash starts as expected.

4. Use the following commands to manage the service:

Disable the service:

```
systemctl disable stash.service
```

Check that the service is set to start at boot time:

```
if [ -f /etc/systemd/system/*.wants/stash.service ]; then echo "On"; else echo "Off";fi
```

Manually start and stop the service:

```
systemctl start stash
systemctl stop stash
```

Check the status of Stash:

```
systemctl status stash
```

Running Stash as a Windows service

This page only applies...

... if you are manually installing or upgrading Stash from an archive file.

If you're using the installer...

... you should read the [Stash Getting started](#) page instead.

Related pages...

- [Running Stash as a Linux service](#)
- [Using Stash in the enterprise.](#)

We recommend that you use the Stash installer to install Stash as a service on Windows. It installs Stash as a service and creates items in the Windows 'Start' menu for starting and stopping Stash – see [Getting started](#).

The information on this page only applies if you are manually installing or upgrading Stash from an archive file. See [Install Stash from an archive file](#).

For long-term use on a Windows server, Stash should be configured to run as a Windows service. This has the following advantages:

- Stash will be automatically restarted when the operating system restarts.
- Stash is less likely to be accidentally shut down, as can happen if the console window Stash was manually started in is closed.
- Stash logs are properly managed by the Windows service.

System administration tasks are [not supported by Atlassian](#). These instructions are only provided as a guide.

Prerequisites

- If you are using a 64-bit version of Windows, first ensure that Stash uses a 64-bit JVM (check by running `java -version` in a Command Prompt, and ensure that the `JAVA_HOME` system environment variable points to the 64-bit JVM), and then replace the 32-bit Tomcat binaries with their 64-bit counterparts in the <Stash installation directory>/bin directory:

```
cd <STASH-INST/bin>
rename tomcat7.exe tomcat7.exe.x86
rename tcnative-1.dll tcnative-1.dll.x86
rename tomcat7.exe.x64 tomcat7.exe
rename tcnative-1.dll.x64 tcnative-1.dll
```

- On any Windows operating system with User Account Control (UAC) such as Windows Vista or Windows 7, simply logging in to Windows with an Administrator account will not be sufficient to execute the script in the procedure below. You must either disable UAC or run 'cmd.exe' as an administrator (e.g. by right-clicking on 'cmd.exe' and choosing **Run as administrator**).
- Ensure the `JAVA_HOME` variable is set to the root of your Java platform's installation directory.
Note: Your `JAVA_HOME` cannot contain spaces, so the default Java installation directory of C:\Program Files\Java won't work.
- Stash should be run from a local **dedicated user account** that does not have admin privileges and that has read, write and execute access to the Stash home directory and the `<Stash installation directory>`. See [Git Push Operations Extremely Slow on Windows](#).
- When you run Stash as a Windows service, all settings in `setenv.bat` are ignored. Ensure that you have set `STASH_HOME` as a *system* environment variable, before running the `service.bat` script.
- If you upgraded Stash from version 1.x to 2.x and Stash stopped running as a service you will need to reinstall the service according to instructions in the [Stash upgrade guide](#).

Setting up Stash as a Windows service

The information in this section only applies if you are manually installing Stash as a Windows service. Alternatively, you can use the Stash installer for Windows to install Stash as a service – see the [Stash Getting started](#) page.

To run Stash as a Windows service:

1. [Stop Stash](#).
2. Create a *system* environment variable with `STASH_HOME` as the **Variable name** and the absolute path to your Stash [home directory](#) as the **Variable value**. Don't use a trailing backslash. Note that the Stash home directory *should not* be located inside the `<Stash installation directory>`. You must do this step *before* running the `service.bat` script in Step 5 below.
3. Open a Command Prompt (as an Administrator – see the 'Prerequisites' section above).
4. Change directory to the Stash installation directory and then into the `bin` subdirectory. If a directory in the path has spaces (e.g. `C:\Program Files\..`), use its eight-character equivalent (e.g. `C:\Prog ra~1\..`).
5. Run the following commands:

```
> service.bat install
> tomcat7 //US//AtlassianStash --Startup auto
```

This will create a service with the name "AtlassianStash" and a display name of "Atlassian Stash". If you would like to customize the name you can instead run:

```
> service.bat install MyName
> tomcat7 //US//MyName --Startup auto
```

This will create the service as "MyName" with a display name of "Atlassian Stash MyName".

6. Run the following command to increase the amount of memory that Stash can use (the default is 768 Mb):

```
> tomcat7 //US//service_name --JvmMx 1024
```

7. Verify that the Stash service comes back up after restarting the machine.

Here is an example:

```
C:\Program Files (x86)\atlassian-stash-2.0.0\bin>service.bat install  
Installing the service 'AtlassianStash' ...  
Using CATALINA_HOME:      "C:\Program Files (x86)\atlassian-stash-2.0.0"  
Using CATALINA_BASE:      "C:\Program Files (x86)\atlassian-stash-2.0.0"  
Using JAVA_HOME:          "C:\Java\jre6"  
Using JVM:                "auto"  
The service 'AtlassianStash' has been installed.  
C:\Program Files (x86)\atlassian-stash-2.0.0\bin>tomcat7.exe //US//AtlassianStash  
--Startup auto  
C:\Program Files (x86)\atlassian-stash-2.0.0\bin>tomcat7.exe //US//AtlassianStash  
--JvmMx 1024  
  
C:\Program Files (x86)\atlassian-stash-2.0.0\bin>net start AtlassianStash  
The Atlassian Stash service is starting.  
The Atlassian Stash service was started successfully.
```

Troubleshooting

- If your service fails to start with "code 4", make sure you ran `service.bat install` in a Command Prompt running as an Administrator.

Scaling Stash

Hardware requirements

The type of hardware you require to run Stash depends on a number of factors:

- The number and frequency of clone operations. Cloning a repository is one of the most demanding operations. One major source of clone operations is continuous integration. When your CI builds involve multiple parallel stages, Stash will be asked to perform multiple clones concurrently, putting significant load on your system.
- The size of your repositories – there are many operations in Stash that require more memory and more CPUs when working with very large repositories. Furthermore, huge Git repositories (larger than a few GBs) are likely to impact the performance of the Git client – see [this discussion](#).
- The number of users.

The following are rough guidelines for choosing your hardware:

- Estimate the number of concurrent clones that are expected to happen regularly (look at continuous integration). Add one CPU for every 2 concurrent clone operations. Note that enabling the [SCM Cache Plugin](#) (bundled with Stash from version 2.5.0) can help to reduce the cloning load on the Stash server due to CI polling. See [Scaling Stash for Continuous Integration performance](#).
- Estimate or calculate the average repository size and allocate $1.5 \times \text{number of concurrent clone operations} \times \min(\text{repository size}, 700\text{MB})$ of memory.

On this page:

- [Hardware requirements](#)
- [Understanding Stash's resource usage](#)
 - [Memory](#)
 - [CPU](#)
 - [Clones examined](#)
- [Configuring Stash scaling options and system properties](#)
- [Database requirements](#)

- [Stash production server data](#)
- [Scaling Stash for Continuous Integration performance](#)
- [Potential performance impact of embedded Crowd directory ordering](#)
- [Stash config properties](#)

Understanding Stash's resource usage

Most of the things you do in Stash involve both the Stash server and one or more Git processes created by Stash. For instance, when you view a file in the Stash web application, Stash processes the incoming request, performs permission checks, creates a Git process to retrieve the file contents and formats the resulting webpage. In serving most pages, both the Stash server and Git processes are involved. The same is true for the 'hosting' operations: pushing your commits to Stash, cloning a repository from Stash or fetching the latest changes from Stash.

As a result, when configuring Stash for performance, CPU and memory consumption for both Stash *and* Git should be taken into account.

Memory

When deciding on how much memory to allocate for Stash, the most important factor to consider is the amount of memory required for Git. Some Git operations are fairly expensive in terms of memory consumption, most notably the initial push of a large repository to Stash and cloning large repositories from Stash. For large repositories, it is not uncommon for Git to use up to 500 MB of memory during the clone process. The numbers vary from repository to repository, but as a rule of thumb $1.5 \times$ the repository size on disk (contents of the .git/objects directory) is a rough estimate of the required memory for a single clone operation for repositories up to 400 MB. For larger repositories, memory usage flattens out at about 700 MB.

The clone operation is the most memory intensive Git operation. Most other Git operations, such as viewing file history, file contents and commit lists are lightweight by comparison.

Stash has been designed to have fairly constant memory usage. Any pages that could show large amounts of data (e.g. viewing the source of a multi-megabyte file) perform incremental loading or have hard limits in place to prevent Stash from holding on to large amounts of memory at any time. In general, the default memory settings (max. 768 MB) should be sufficient to run Stash. The maximum amount of memory available to Stash can be configured in `setenv.sh` or `setenv.bat`.

⚠️ The memory consumption of Git is not managed by the memory settings in `setenv.sh` or `setenv.bat`. The

Git processes are executed outside of the Java virtual machine, and as a result the JVM memory settings do not apply to Git.

CPU

In Stash, much of the heavy lifting is delegated to Git. As a result, when deciding on the required hardware to run Stash, the CPU usage of the Git processes is the most important factor to consider. And, as is the case for memory usage, cloning large repositories is the most CPU intensive Git operation. When you clone a repository, Git on the server side will create a *pack file* (a compressed file containing all the commits and file versions in the repository) that is sent to the client. While preparing a pack file, CPU usage will go up to 100% for one CPU.

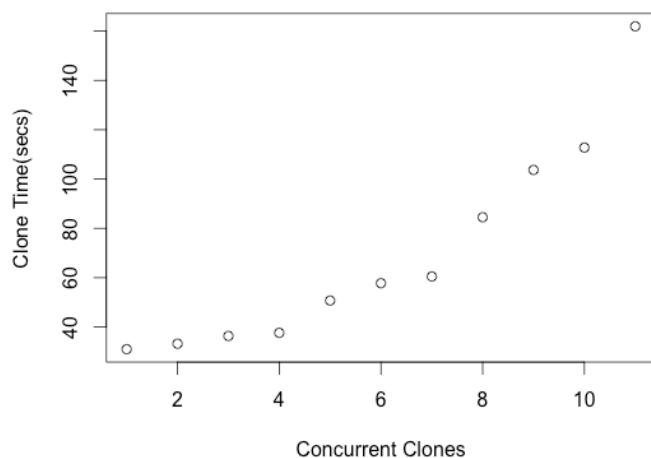

For users that connect to Stash using SSH, the encryption of data adds to overall CPU usage. For day-to-day push and pull operations the overhead will not be significant, but when cloning repositories the overhead will be noticeable.

- i To get the maximum performance from Stash, we advise configuring automatic build tools to use the http or https protocol, if possible.

Clones examined

Since cloning a repository is the most demanding operation in terms of CPU and memory, it is worthwhile analyzing the clone operation a bit closer. The following graphs show the CPU and memory usage of a clone of a 220 MB repository:

This graph shows how concurrency affects average response times for clones:

- Vertical axis: average response times.
- Horizontal axis: number of concurrent clone operations.

The measurements for this graph were done on a 4 CPU server with 12 GB of memory.

Response times become exponentially worse as the number of concurrent clone operations exceed the number of CPUs.

Configuring Stash scaling options and system properties

Stash limits the number of Git operations that can be executed concurrently, to prevent the performance for all clients dropping below acceptable levels. These limits can be adjusted – see [Stash config properties](#).

Database requirements

The size of the database required for Stash depends in large part on the number of repositories and the number of commits in those repositories.

A very rough guideline is: $100 + ((\text{total number of commits across all repos}) / 2500)$ MB.

So, for example, for 20 repositories with an average of 25,000 commits each, the database would need $100 + (20 * 25,000 / 2500) = 300$ MB.

Overview of Stash

Atlassian Stash is the on-premises Git repository management solution for enterprise teams. It allows everyone in your organisation to easily collaborate on your Git repositories.

This page provides an overview of the core strengths of Stash.

On this page:

- Git repository management
- Permissioning granularity - access control
- Enterprise focus
- User management
- Database support
- Supported platforms
- Security
- Code visibility
- Code reviews
- Integration with JIRA
- Integration with Bamboo CI
- Workflow strategies
- Atlassian ecosystem
- Atlassian support

Git repository management

Stash provides a simple and powerful interface to create and manage Git repositories. Create repositories in a couple of clicks, then quickly choose the users and groups who will be contributors to the project, and those who will be just observers.

Projects for repository management

Since projects rarely consist of a single repository, Stash provides a convenient **Project structure**. This helps you to organise and manage repositories, and provides the basis on which to manage access to your repositories.

With Stash you can empower end users to manage repositories themselves, while keeping control of the key administration functions. And because we want to make it easy for you to manage teams, Stash has a group management feature to help you grant permissions across your organisation.

Permissioning granularity - access control

Stash keeps you and your developers productive by providing a way to structure your repositories and manage permissions with a simple, yet powerful, user interface.

Global permissions

Delegate administration of projects to key users and groups, to give your developers the freedom to create and manage repositories

Projects permissions

Use simple permissions at the project level to control access to repositories for users and groups

The new permission screens provide a great overview of who has access to your projects, and managing permissions is even faster.

[More...](#)

Repository permissions

Branch permissions

Per-branch "write" permissions for individuals and groups ensure that stable branches remain stable, and development branches foster collaboration. It's a whole new level of Enterprise security.

Some development workflows require that specific developers oversee merges into the master or release branches, while other developers work on bug-fix and feature branches. Branch Permissions let you turn this "gentlemen's agreement" into a seamless, enforceable process, reducing confusion and time wasted backing out changes that were merged prematurely.

Read more about [branch permissions](#) in Stash.

Enterprise focus

Stash has everything you need to create and manage Git repositories efficiently behind the safety of your own firewall.

Stash doesn't force administrators to use a pre-packaged appliance and so give up control. Whether on **Windows**, **Linux** or **MacOS X**, Stash will feel right at home on all platforms.

Enterprise licenses

From growing startups to the Fortune 100, Atlassian Enterprise offers products and services that are built to match the needs of the largest enterprise customers. With the new Enterprise tiers for Stash, Atlassian has you covered no matter how big your organisation is. And of course, just like JIRA and Confluence, the Stash Enterprise licenses come with 24x7 Personalized Phone Support.

User management

With **LDAP**, **Crowd** and **JIRA** support, you can manage a small team easily in Stash's internal directory, or 500 developers in your corporate directory.

Single sign-on with Crowd

Atlassian Crowd allows enterprise teams to integrate and deploy single sign-on (SSO) using popular directory servers such as Active Directory or OpenLDAP. Now your team members need only log in once to any of your Atlassian applications (JIRA, Confluence, Bamboo) to be able to access all of them, without repeatedly typing in

their password.

- *IT administrators* can centralize user management through Crowd and provide SSO for all Atlassian apps with minimal configuration.
- *End-users* enjoy the convenience of logging in once to any Atlassian application, avoiding the interruption of repeated authentication across other applications. Log in once, and you're automatically logged in to all applications connected to Crowd, including Stash.

Read more about using SSO with Stash.

Database support

MySQL, PostgreSQL, SQL Server and Oracle support

Stash now has support for all these major databases: MySQL, Oracle, PostgreSQL and Microsoft SQL Server. Choose the database that best fits your needs, or your system administrator is most familiar with, or that your company is already using. [More...](#)

Database migration

Switch easily from the database embedded in Stash to your organisation's existing technology stack, and migrate painlessly if your system administrators change the infrastructure. Stash scales and adapts as your requirements change. [More...](#)

Supported platforms

Security

SSH support - authentication

Developed from the ground up with enterprise level security as a #1 priority, Stash now supports SSH in addition to HTTPS. You can either use standard HTTPS authentication, or set up your public keys and connect to Stash using SSH. This resolves Stash's #1 feature request, focused on adding support for SSH security.

Developers can manage their own SSH keys, and add as many as they like. Stash administrators can grant or revoke the SSH keys of any user. [More...](#)

Code visibility

Code search

File search

Stash's new file search ensures that you can quickly find any file in your repository, without needing to check out the source. Just start typing any part of the file name into the search field and you'll get a list of matches, fast. And you can filter by path, CamelCase (for example, AttrM to match AttributeMap) and file extension.

Image diffs

Stash makes diffs more accessible to everyone on your team, not just the back-end coders.

Have you ever tried to find the subtle difference between two images? That difference may be small like a text change or as large as a page redesign. Web designers, front-end developers, and maybe a few QA folks, rejoice and check out Stash's interactive image diff viewer.

Maybe even more useful is ediffs. When viewing a diff it can sometimes be difficult to distinguish textual changes. Stash solves this with the addition of ediffs so you can clearly see the textual changes added or removed between two revisions.

Code reviews

Pull requests

With Stash and Pull Requests, code reviews become an integral part of your development process. Development happens on branches and when code is ready to be merged into the main branch a Pull Request is opened. Unless the code has been reviewed as part of a Pull Request, it does not get integrated back into the main branch. All the benefits of code review baked right into your workflow!

Creating a pull request is like starting a discussion. Your reviewers can see the changes you have made, comment on those changes and commit further changes and improvements to the branch if required. When everyone agrees, the branch can then be merged back to master or your main development branch.

Getting your code reviewed has never been easier – simply click the **Pull Request** button in the repository

header, select the branch you've been working on, the branch you want to merge to, then add a short description and you're done.

Read more about using pull requests in Stash.

Integration with JIRA

Issues

Pull requests

Developers create pull requests when their code is ready for peer review before merging a development branch into the main code line. To make pull requests most effective, reviewers need more context around the changes: What bug or feature is this pull request resolving? What are the details of those issues? Are any of the issues still open?

Pull requests now tightly integrate with JIRA, putting issue details front and center. View the status of an issue, along with its assignee and description to get the scoop without ever leaving Stash. This allows reviewers to

- Gain contextual awareness into the task which is being worked on by looking at descriptions, comments and attachments
- Quickly review the requirements for a new feature or bugfix
- Click straight through into JIRA, to keep issues up to date for upcoming releases

Read more about pull requests in Stash.

Integration with Bamboo CI

Integration with Bamboo and other CI build tools

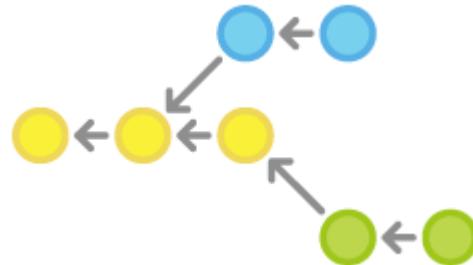

Workflow strategies

Git repository hooks

Git hooks allow you to customise your development team's workflow for any requirement they may have. Admins can enable and configure hooks for each repository, right within Stash, without having to install them on the file-system.

Stash comes bundled with repository hooks to let you start customising Stash straight off.

Read more about using [repository hooks](#) in Stash.

| Branch | Users | Groups |
|----------------------------|-------------------------------|-------------------------------|
| STASHDEV-2237-diff-scro... | Adam Ahmed
Jens Schumacher | No groups have been permitted |
| master | No users have been permitted | stash-admins |
| release/2.0 | Seb Ruiz | No groups have been permitted |

Atlassian ecosystem

Marketplace add-ons

Visualise information about your Git repository, comment on your code in-line, collect achievements when committing code or receive change notifications in [HipChat](#). With almost a dozen add-ons available on the [Atlassian Marketplace](#), you can extend Stash to suit your needs.

Public API for custom integrations

API for hook integrations

We've leveraged native Git hooks to create a new hooks API that allows developers to easily write their own hooks. Stash handles the persistence, packaging and per-repository configuration for your hooks, making it simple to extend Stash to suit your particular project's needs. Read more about [writing hooks for Stash](#) in our revamped developer docs.

Furthermore, you can mix-and-match bundled Stash hooks with hooks from the [Atlassian Marketplace](#). You can find and install these from within Stash – simply use the **Add hook** button on the hooks settings page to view available hooks from the marketplace.

API for build status

Picture this: you're about to click the 'merge' button, and then you pause to consider: *did these changes pass all their tests?* To answer that, it's important to know what the latest build status of the branch is before the changes are integrated into master. But don't waste time navigating to your build system and sifting through test data to see whether the changes passed or failed. Stash 2.1 does it automatically. Our new build status API allows build servers, such as Bamboo and Jenkins, to publish build details to the pull request's overview, giving you a quick idea of whether the pull request is good to merge or not.

Read more about the [build status API](#) in our developer documentation.

Atlassian support

Scaling Stash for Continuous Integration performance

If you've got CI or other automatic tooling set up to poll Stash for changes, you can end up with high load on your Stash server. Consider for instance a CI server that has a number of builds set up for a given repository. Each of those builds polls Stash for changes and when it detects a change, it starts a new build. If your CI server supports parallel and/or chained build steps, each of these builds typically results in multiple clone operations of the same repository. The result: lots of polling for changes, and bursts of clones of a repository.

Caching

CI results in highly repetitive calls to Stash: polling for changes typically results in the same response 90% of the time and a build triggers a number of identical clone calls to Stash. Both operations can benefit greatly from caching when you experience repetitive load from CI.

Stash 2.5, and later versions, ship with the SCM Cache plugin already bundled. The plugin is enabled by default, but note that ref advertisement is disabled by default – see the 'Limitations' section below. The plugin is also available from the [Atlassian Marketplace](#).

On this page:

- [Limitations](#)
- [Considerations](#)
- [Enabling and disabling caching](#)
- [Configuration](#)
- [REST API](#)

Related pages:

- [Scaling Stash](#)
- [Stash config properties](#)

Limitations

- Caching can be applied to 'ref advertisement' (polling for changes), clone and shallow clone requests only. Fetch/pull operations are not cached, but these operations will still benefit from the 'ref advertisement' cache.
- As a precaution, ref advertisement caching is *disabled* by default. The openness of the plugin system means that plugins (or manually installed git hooks) could be updating refs in repository without the caching plugin detecting these changes. The result would be a stale refs cache and failing clone/fetch operations. However, if you know that there are no plugins or git hooks installed that make changes to the repository directly, you can enable the ref advertisement caching using the system properties listed in the Configuration section below. Note that as an additional precaution, the ref advertisement caches are configured to automatically expire after a minute.

Considerations

The application stores cache data on disk for both ref advertisements and for clone operations for a configurable period of time. Since large instances can potentially consume an entire disk the SCM Cache monitors remaining disk space and is automatically disabled when the configured minimum free disk space is reached.

See [Stash config properties](#) for descriptions of the available system properties.

Enabling and disabling caching

Enable the SCM Cache Plugin from the admin area in Stash. Click **Manage Add-ons** (under 'Add-Ons') and filter for system add-ons. Click **SCM Cache Plugin for Stash** and then either **Enable** or **Disable**.

Configuration

The SCM Cache Plugin for Stash can be configured using either the REST endpoint (some settings, not all) or the system properties in <STASH-HOME>/stash-config.properties. Settings configured through REST are considered *before* the settings in stash-config.properties.

REST API

| Method | Url | Description |
|--------|-----|-------------|
|--------|-----|-------------|

| | | |
|--------|--|---|
| GET | /rest/scm-cache/latest/config/protocols | Retrieve the protocols for which caching has been enabled. |
| PUT | /rest/scm-cache/latest/config/protocols/{protocol} | Enable caching of hosting requests for the protocol (HTTP or SSH). |
| DELETE | /rest/scm-cache/latest/config/protocols/{protocol} | Disable caching of hosting requests for the protocol (HTTP or SSH). |
| GET | /rest/scm-cache/latest/config/refs/enabled | Retrieve whether ref advertisement caching is enabled (true) or disabled (false). |
| PUT | /rest/scm-cache/latest/config/refs/enabled/{status} | Enable (status = true) or disable (status = false) ref advertisement caching. |
| GET | /rest/scm-cache/latest/config/refs/ttl | Retrieve the expiry in seconds for the ref advertisement caches. |
| PUT | /rest/scm-cache/latest/config/refs/ttl/{expiryInSec} | Set the expiry in seconds for the ref advertisement caches. |
| GET | /rest/scm-cache/latest/config/upload-pack/enabled | Retrieve whether clone caching is enabled (true) or disabled (false). |
| PUT | /rest/scm-cache/latest/config/upload-pack/enabled/{status} | Enable (status = true) or disable (status = false) clone caching. |
| GET | /rest/scm-cache/latest/config/upload-pack/ttl | Retrieve the expiry in seconds for the clone caches. |

| | | |
|--------|---|---|
| PUT | /rest/scm-cache/latest/config/upload-pack/ttl/{expiryInSec} | Set the expiry in seconds for the clone caches. |
| GET | /rest/scm-cache/latest/caches | Retrieve information about the current caches: size, number of cache hits and misses, etc. |
| DELETE | /rest/scm-cache/latest/caches | Clear all caches. |
| GET | /rest/scm-cache/latest/caches/{projectKey}/{repoSlug} | Retrieve information about the caches for the repository identified by projectKey and repoSlug: size, number of cache hits and misses, etc. |
| DELETE | /rest/scm-cache/latest/caches/{projectKey}/{repoSlug} | Clear the caches for the repository identified by projectKey and repoSlug. |

Stash production server data

This page provides some data around the Stash production instance that we run internally at Atlassian. We're providing this to give some idea of how Stash performs in a production environment. Please realise that this information is entirely specific to this particular instance – the details of your own installation may result in different performance data.

This data was collected with New Relic in February 2013, when the server was running a pre-release version of Stash 2.2.

On this page:

- [Hardware](#)
- [Load](#)
- [Server load](#)
- [Git operations](#)

Hardware

The Atlassian Stash production server runs on:

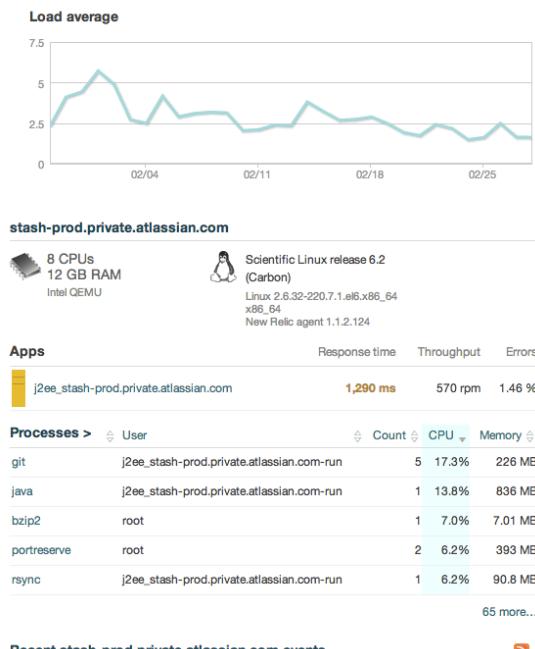

- Virtualised hardware
- 4 Hyper-threaded cores
- 12 GB RAM

Load

Load data summary for February 2013:

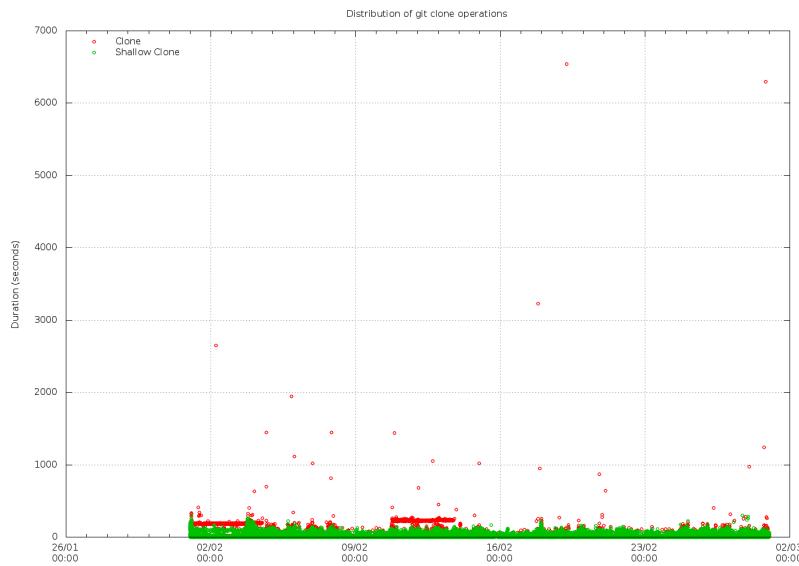

| Type | Load |
|---------------------------------|---|
| CPU usage | less than 30% on average |
| Load average | less than 3 on average |
| Physical Memory | peaked at 31% |
| Processes | Git: 17.3% CPU
Java: 18.8% CPU |
| Clones | on average less than 300ms |
| Git operations/hour | peaking at 11,000 with an average of about 3,500 |
| Concurrent connections/hour | peaking at 100 connections with an average of about 40 concurrent connections |
| CI running against Stash server | 3 build servers with approximately 300 agents |

Server load

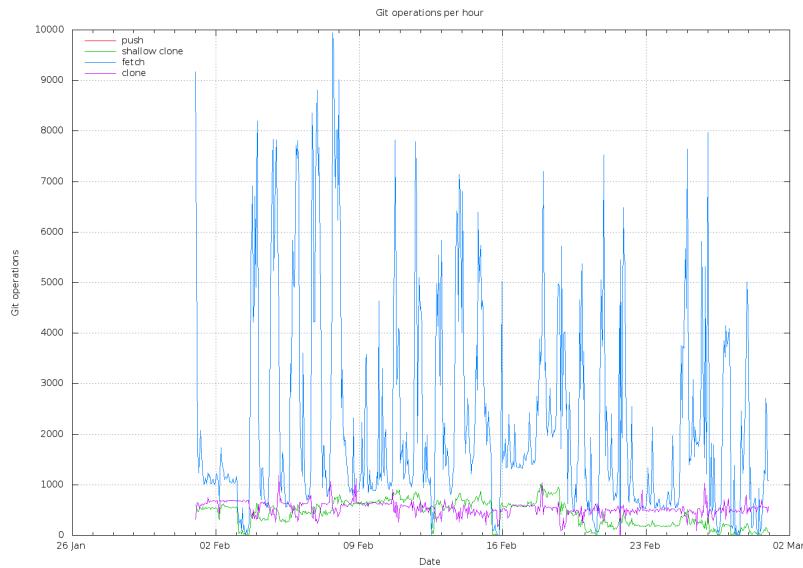

Git operations

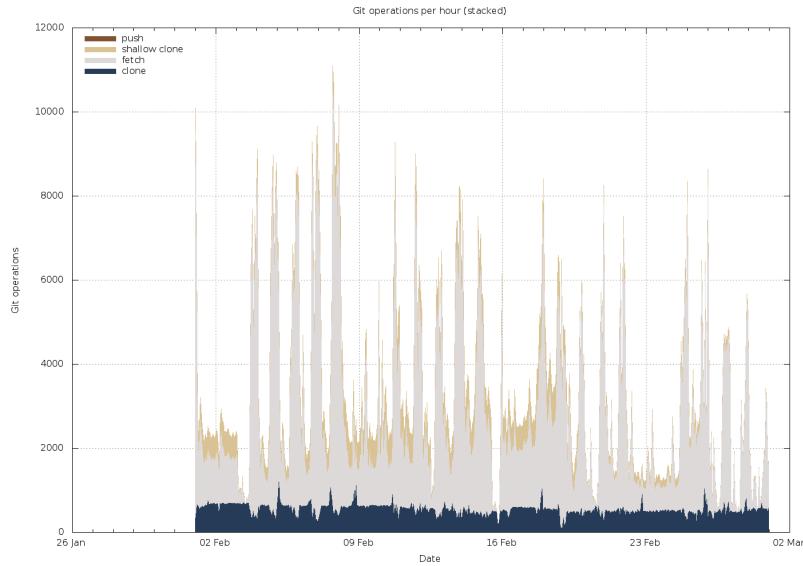

Git clone operations

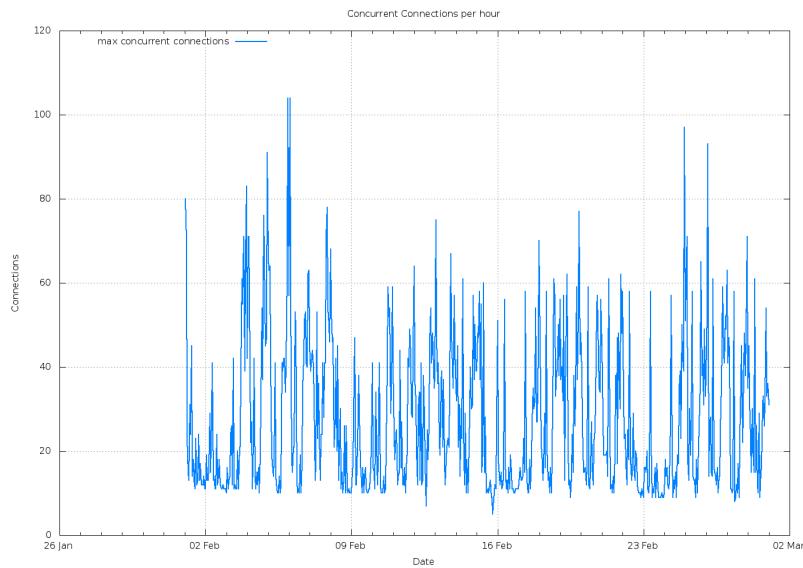

Git operations per hour

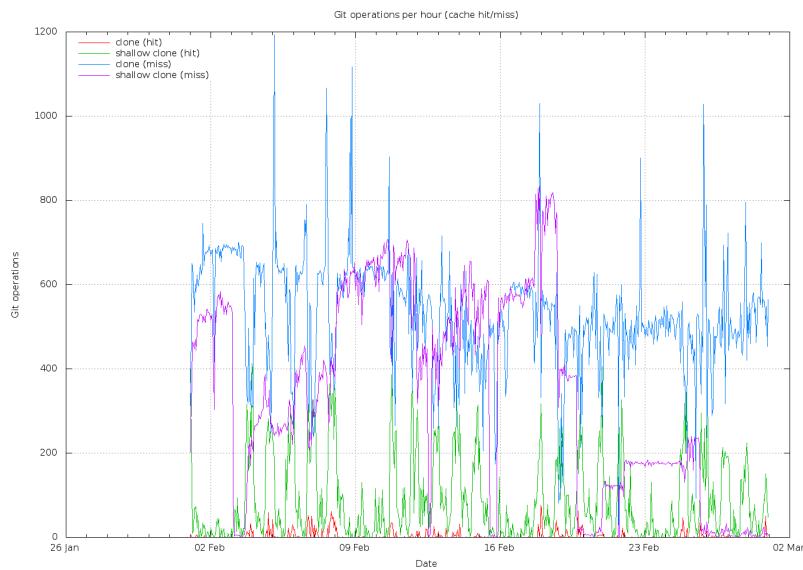

Git operations per hour (stacked)

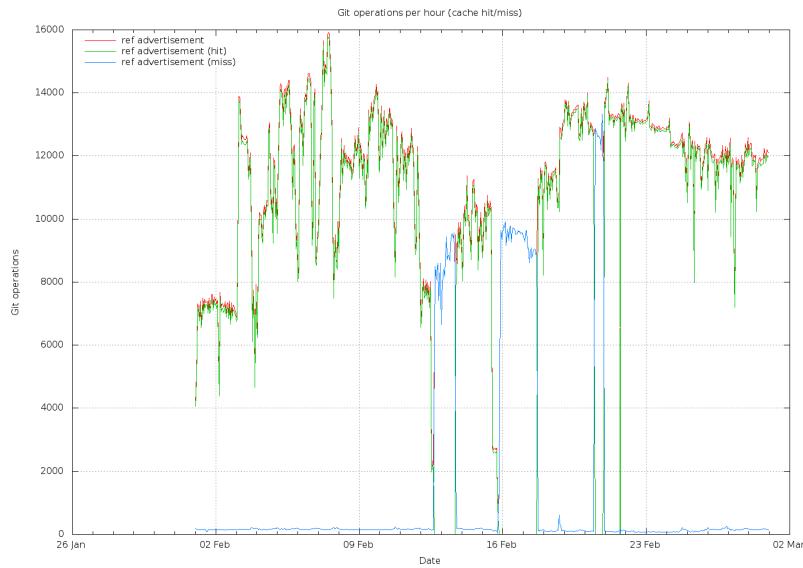

Concurrent connections per hour

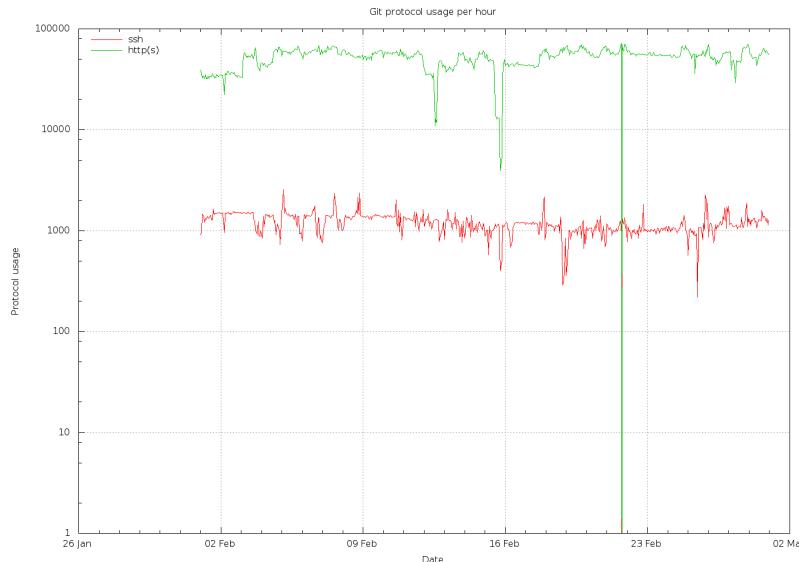

Git operations - cache hit/miss

Git operations - cache hit/miss

Git protocol usage per hour

High availability for Stash

If Stash is a critical part of your development workflow, maximizing application availability becomes an important consideration. This guide aims at providing the background information you need to be able to set up Stash in a highly available configuration. There are however many possible configurations for setting up a HA environment for Stash, depending on the infrastructure components and software (SAN, clustered databases, etc.) you have at your disposal. This guide aims at providing a high-level overview and describes a possible configuration in more detail.

i Please note that your feedback and comments are welcome! We very much value additional lessons learned from your experience with alternative scenarios!

High availability

[High availability](#) describes a set of practices aimed at delivering a specific level of "availability" by eliminating and/or mitigating failure via redundancy. Failure can result from unscheduled down-time due to network errors, hardware failures or application failures, but can also result from failed application upgrades. Practices for achieving high availability range from organizational concerns such as change management to automated failover procedures when system failures are detected. Setting up a highly available system involves:

- **Proactive Concerns**
 - Change Management (including Staging / Production instances for change implementation)
 - Create redundancy of network, application, storage and databases
 - Monitoring system(s) for both the network and applications
- **Reactive Concerns**
 - Technical Failover mechanism, either automatic or scripted semi-automatic with manual switchover
 - Standard Operating Procedure for guided actions during crisis situations

This guide assumes that processes such as change management are covered and will focus on [redundancy / replication](#) and [failover procedures](#). When it comes to setting up your infrastructure to quickly recover from system or application failure, you have different options. These options vary in the level of uptime they can provide. In general, as the required uptime increases, the complexity of the infrastructure and the knowledge required to administer the environment increases as well (and by extension the cost goes up as well).

Understanding the availability requirements for Stash

Central version control systems such as Subversion, CVS, ClearCase and many others require the central server to be available for any operation that involves the version control system. Committing code, fetching the latest changes from the repository, switching branches or retrieving a diff all require access to the central version control system. If that server goes down, developers are severely limited in what they can do. They can continue coding until they're ready to commit, but then they're blocked.

Git is a distributed version control system and developers have a full clone of the repository on their machines. As a result, most operations that involve the version control system don't require access to the central repository. When Stash is unavailable developers are not blocked to the same extent as with a central version control system.

As a result, the availability requirements for Stash *may* be less strict than the requirements for say Subversion.

| Consequences of Stash unavailability | |
|--|--|
| Unaffected | Affected |
| Developer:
<ul style="list-style-type: none"> • Commit code • Create branch • Switch branches • Diff commits and files • ... • Fetch changes from fellow developers | Developer:
<ul style="list-style-type: none"> • Clone repository • Fetch changes from central repository • Push changes to central repository • Access Stash UI - create/do pull requests, browse code Build server:
<ul style="list-style-type: none"> • Clone repository • Poll for changes Continuous Deployment:
<ul style="list-style-type: none"> • Clone repository |

Failover options

High availability and recovery solutions can be categorized as follows:

| Failover option | Recovery time | Description | Possible with Stash |
|-----------------|---------------|-------------|---------------------|
| | | | |

| | | | |
|--------------------------------|---|--|--|
| Automatic correction / restart | 2-10 min (application failure)
hours-days (system failure) | <ul style="list-style-type: none"> Single node, no secondary server available Application and server are monitored Upon failure of production system, automatic restarting is conducted via scripting Disk or hardware failure may require reprovisioning of the server and restoring application data from a backup | |
| Cold standby | 2-10 min | <ul style="list-style-type: none"> Secondary server is available Stash is NOT running on secondary server Filesystem and (optionally) database data is replicated between the 'active' server and the 'standby' server All requests are routed to the 'active' server On failure, Stash is started on the 'standby' server and shut down on the 'active' server. All requests are now routed to the 'standby' server, which becomes 'active'. | |
| Warm standby | 0-30 sec | <ul style="list-style-type: none"> Secondary service is available Stash is running on both the 'active' server and the 'standby' server, but all requests are routed to the 'active' server Filesystem and database data is replicated between the 'active' server and the 'standby' server All requests are routed to the 'active' server On failure, all requests are routed to the 'standby' server, which becomes 'active' This configuration is currently not supported by Stash, because Stash uses in-memory caches and locking mechanisms. At this time, Stash only supports a single application instance writing to the Stash home directory at a time. | |

Automatic correction

Before implementing failover solutions for your Stash instance consider evaluating and leveraging automatic correction measures. These can be implemented through a monitoring service that watches your application and performs scripts to start, stop, kill or restart services.

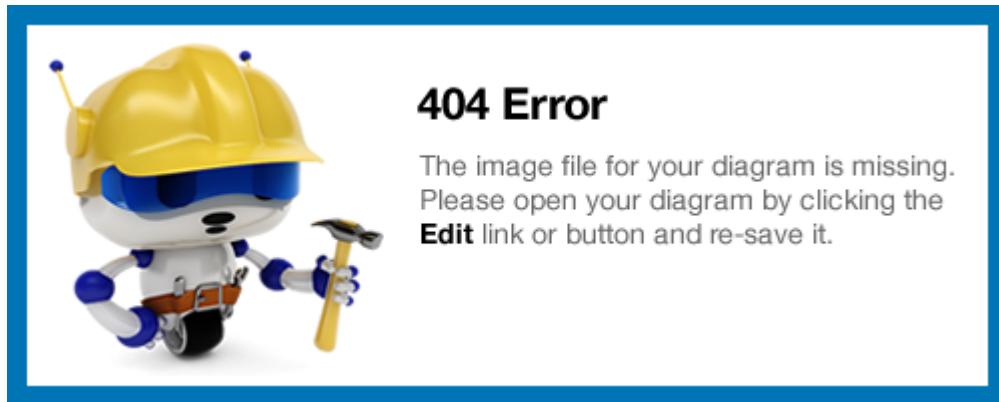

1. A Monitoring Service detects that the system has failed.
2. A correction script attempts to gracefully shut down the failed system.
 - a. If the system does not properly shut down after a defined period of time, the correction script kills the process.
3. After it is confirmed that the process is not running anymore, it is started again.
4. If this restart solved the failure, the mechanism ends.
 - a. If the correction attempts are not or only partially successful a failover mechanism should be triggered, if one was implemented.

Cold standby

The cold standby (also called Active/Passive) configuration consists of two identical Stash servers, where only one server is ever running at a time. The Stash home directory on each of the servers is either a shared (and preferably highly available) network file system or is replicated from the active to the standby Stash server. When a system failure is detected, Stash is restarted on the active server. If the system failure persists, a failover mechanism is started that shuts down Stash on the active server and starts Stash on the standby server, which is promoted to 'active'. At this time, all requests should be routed to the newly active server.

For each component in the chain of high availability measures, there are various implementation alternatives. Although Atlassian does not recommend any particular technology or product, this guide gives examples and options for each step. In the following, each component in the system is described and an example configuration is used to illustrate the descriptions.

System setup

| Component | Description |
|---------------------------|--|
| Request Router | Forwards traffic from users to the active Stash instance. |
| High Availability Manager | Tracks the health of the application servers and decides when to fail over to a standby server and designate it as active.
Manages failover mechanisms and sends notifications on system failure. |
| Stash server | Each server hosts an identical Stash installation (identical versions).
Only one server is ever running a Stash instance at any one time (known as the active server). All others are considered as standbys.
The Stash home directory resides on a replicated or shared file system visible to all application servers (described in more detail below).
The Stash home directory must never be modified when the server is in standby mode. |
| Stash DB | The production database, which should be highly available. How this is achieved is not explored in this document. See the following database vendor-specific information on the HA options available to you: |

| Database | More Information |
|-----------|---|
| Postgres | http://www.postgresql.org/docs/9.2/static/high-availability.html |
| MySQL | http://dev.mysql.com/doc/refman/5.5/en/ha-overview.html |
| Oracle | http://www.oracle.com/technetwork/database/features/availability/index.html |
| SQLServer | http://technet.microsoft.com/en-us/library/ms190202.aspx |

Example HA implementation

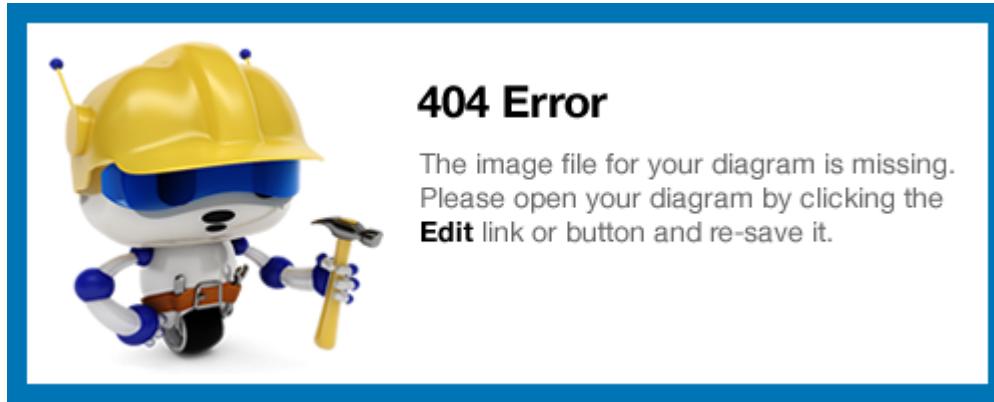

! This particular implementation is provided to illustrate the concepts, but hasn't been tested in production. We strongly recommend that you devise a solution that best fits your organisation's existing best practices and standards and is thoroughly tested for production readiness.

The example configuration that we'll use to illustrate the concepts consists of a Linux cluster of two nodes. Each node is a CentOS server with Java, Git and Stash installed. Stash's home directory is replicated between the

nodes using **DRBD**, a block-level disk replication mechanism. The cluster is managed by **CMAN**. Pacemaker, a high availability resource manager, is used to manage two HA resources: Stash and a Virtual IP.

Pacemaker runs on each machine, elects the 'primary' node for Stash and starts Stash on this node. The Virtual IP resource is configured to run on the same node as the Stash resource, removing the need for a separate 'request router' component. Pacemaker monitors Stash and when it detects a failure tries to restart Stash on the primary node. If the restart fails, or does not resolve the issues, it fails over to the secondary node. The Virtual IP resource is configured to run on the same node as the Stash resource and will also be moved to the secondary node.

Scripts to create a virtual network based on this example configuration using packer, vagrant and VirtualBox can be found in the [stash-ha-example](#) repository. Specifically, the scripts for installing the required software components can be found in the [packer/scripts](#) directory. The scripts for configuring the cluster can be found in the [vagrant/scripts](#) directory.

Request router

All high availability solutions are based on redundancy, monitoring and failover. In the cold standby approach, only one server is running Stash at a time. It is the request router's responsibility to route all incoming requests to the node that is currently the primary node. For full high availability, the request router should be highly available itself, meaning that the component is monitored by the HA manager and can be failed over to a redundant copy in the network.

Requirements

- Routes all incoming requests to the node that is currently the 'primary' node
- Should be highly available itself

Options

- HAProxy
- Keepalived
- LVS
- LinuxHA
- various [commercial solutions](#)

Solution in example HA implementation

The example HA implementation does not include a separate Request Router server. Instead it includes a [virtual IP](#) HA resource that is co-located with the Stash resource. The virtual IP resource is managed by Pacemaker and will be moved to the standby node when the Stash resource fails over to the standby node.

Data replication

Stash stores its data in two places: the Stash home directory and the database that you have configured. The Stash home directory contains, among other things, the Git repositories being managed by Stash (with some additional Stash-specific files and directories), installed plugins, caches and log files. The database contains, among other things, your project and repository information and metadata, pull requests data and the data for your installed plugins.

Data in Stash's home directory and in the database are *very* tightly coupled. For instance, repository pull

requests have their metadata, participants and comments stored in the database but certain Git-oriented information around merging and conflicts (which are used to display the diffs in the user interface) are stored in the managed Git repositories. If the two were to fall out of sync you might see an incorrect pull request diff, you might be left unable to merge the pull request, or Stash may simply refuse to display the pull request at all. Similarly, Stash plugins are installed from jar files in the Stash home directory but their state is stored in the database. If the two were to fall out of sync then plugins may malfunction or not appear installed at all, thus degrading your Stash experience.

When designing a high availability solution for Stash based on a replicated file system and database, it's important that the file system replication is atomic. The replicated file system must be a consistent *snapshot* of the 'active' filesystem. This is important because changes to a Git repository happen in predictable ways: first the objects (files, trees and commits) are written to disk, followed by updates of the refs (branches and tags). Some synchronisation tools such as `rsync` perform file-by-file syncing, which can result in an inconsistent Git repository if the repository is modified while the sync is happening (for example, if object files have not been synced, but the updated refs have been).

Furthermore, the tight coupling between the Stash home directory and database makes it essential that the Stash home directory and database are *always* consistent and in sync (see [here](#) for more information). By extension, this means that any high availability solution based on a replicated file system and database needs to ensure that the replicated file system and database are in sync. For example, if the replication is based on hourly synchronisation to a standby node, care must be taken to ensure that the synchronisation of the database and filesystem happen at the same time.

Requirements

- File system replication must replicate a consistent *snapshot* of Stash's home directory.
- The database and the file system must be replicated at the same time.

Options

- DRBD
- LVM
- SAN
- NAS
- various commercial solutions

Solution in example HA implementation

The example HA implementation uses a DRBD managed block device for its Stash home directory. By default, DRBD runs in a Primary/Secondary configuration in which only a single node can mount the DRBD managed volume at a time. In this configuration, DRBD should be managed by Pacemaker to ensure that the DRBD volume is co-located with the Stash resource.

In preparation for experimentation with an Active/Active configuration, the example HA implementation has configured DRBD in a dual-primary configuration, which allows both nodes to mount the DRBD managed volume at the same time.

Monitoring

To allow for monitoring in a high availability environment, Stash, since version 2.10, has supported a REST-based health check endpoint at `/status` that describes the current health of the instance. This endpoint supports only the GET verb and requires no authentication, XSRF protection header values, or mime-type headers. The `/status` endpoint has been designed to return sane output even when Stash is currently unavailable as a result of database migration or backup. Please note that other URLs such as `/login` or `/rest/api/latest/application-properties` will redirect to the maintenance page when Stash is performing database migration or backup. Using these endpoints may unintentionally trigger failover when these URLs are used for monitoring the health of the system.

Example usage:

```
> curl -i -u user -X GET http://localhost:7990/stash/status
Enter host password for user 'user':
HTTP/1.1 200 OK
Server: Apache-Coyote/1.1
X-REQUESTID: 1040x7x0
X-XSS-Protection: 1; mode=block
X-Frame-Options: SAMEORIGIN
X-Content-Type-Options: nosniff
Content-Type: application/json; charset=ISO-8859-1
Content-Length: 19
Date: Tue, 07 Jan 2014 17:20:04 GMT
{"state": "RUNNING"}
```

The following is a list of the responses the /status health check endpoint will return:

| HTTP Status Code | Response entity | Description |
|------------------|--------------------------|--|
| 200 | {"state": "RUNNING"} | Stash is running normally |
| 500 | {"state": "ERROR"} | Stash is in an error state |
| 200 | {"state": "MAINTENANCE"} | Stash is in maintenance mode |
| 200 | {"state": "STARTING"} | Stash is starting |
| 200 | {"state": "STOPPING"} | Stash is stopping |
| 200 | {"state": "FIRST_RUN"} | Stash is running for the first time and has not yet been configured |
| 404 | | Stash failed to start up in an unexpected way (the web application failed to deploy) |

If a connection error occurs when trying to connect to the endpoint (but the server is reachable) then Tomcat has failed to start.

Monitoring frequency

Stash's health check is simple and not resource intensive. You should feel free to check as often as is deemed necessary to maximise continuity of Stash in your organisation. We do recommend, however, to not check more frequently than every 15 seconds so that the HA resource manager / cluster does not mistake transitory slowdowns such as stop-the-world garbage collection in Stash's JVM. We recommend a monitor timeout of 30 seconds because the first check after startup can be fairly slow. After startup completes, the check should take only a few milliseconds.

Requirements

- Monitoring scripts must use the /status URL. Any other URL may redirect to the maintenance page when a backup is being performed, unintentionally triggering failover.
- When a request to /status returns anything other than a 200 status code, Stash should be considered to be in an error state and should be failed over the standby node.

Solution in example HA implementation

The example HA implementation includes an OCF compliant script that's used for monitoring Stash's health. The script can be found [here](#).

Failover

The following table outlines how we recommend that your HA resource manager responds to failure events:

| Event | Response |
|---|--|
| Network connection from the request router to Stash is lost | Failover to a secondary node |
| Server failure | Failover to a secondary node |
| Stash crashes completely | Restart Stash on the active node |
| Stash reaches its memory limits (OOME) | Restart Stash on the active node |
| Stash loses connection to the database | Nothing. Stash will recover when the database comes back on line.
Stash on another node will also fail to start if the database is unavailable. |
| The database is reported down | Nothing. Stash will recover when the database recovers.
Stash on another node will also fail to start. |
| Stash fails to start up (e.g. wrong Git binary version) | Nothing. Manual intervention required.
Stash on another node will also fail to start. |

Split brain

A split-brain condition results when a cluster of nodes encounters a network partition and multiple nodes believe the others are dead and proceed to take over the cluster resources. In the context of a Stash HA installation this would involve multiple Stash instances running concurrently and making filesystem and database changes, potentially causing the filesystem and database to fall out of sync. As previously noted this must not be permitted to happen. There are several ways to address this:

Network redundancy

This involves configuring redundant and independent communications paths between nodes in the cluster. If you maximise the connectivity between nodes you minimise the likelihood of a network partition and a split brain. This is a preventative measure but it is still sometimes possible for the network to partition.

Resource fencing

This involves ensuring that the first node that believes the others are dead 'fences off' access to the resource that other nodes (which appear dead but may still be alive) may try to access. The losing nodes are prevented from making modifications, therefore maintaining consistency. In a Stash HA, the resources that would need to be fenced are the database and the replicated file system.

Node fencing or STONITH

This is a more aggressive tactic and again involves the first node that believes the others are dead, but instead of fencing off access to particular resources, it denies all resource access to them. This is most commonly achieved by power-cycling the losing nodes (aka "Shoot The Other Node In The Head" or STONITH). In a Stash HA, this would involve power-cycling the losing Stash servers.

Requirements

- The application should fail over to a secondary node when a server failure is detected by the cluster manager (that is, the whole node is down or unreachable).
- When an application failure is detected, the application should be restarted. If restarting does not resolve the issue, the application should be failed over to a secondary node.

Solution in example HA implementation

The example implementation uses Pacemaker to manage failover. Pacemaker in turn uses the provided OCF

script to properly shut down the failing Stash and start Stash on the secondary node.

Please note that the vagrant provisioning script in the example implementation contains a simplified configuration that is aimed at testing failover. It configures Stash to immediately failover to a secondary node, without attempting to restart the application. It also disables the STONITH feature for ease of testing. In a production system, at least one restart should be attempted before failing over and STONITH should be enabled to handle 'split brain' occurrences.

Stash config properties

This page describes the Stash system properties that can be used to control aspects of the behaviour in Stash. System properties are contained in the `stash-config.properties` file, in the shared folder of your [Stash home directory](#).

Stash must be restarted for changes to become effective.

Default values for system values, where applicable, are specified in the tables below.

Audit

| Property | Description |
|----------|-------------|
|----------|-------------|

| | |
|---|---|
| <code>audit.highest.priority.to.log=HIGH</code> | <p>Defines the lowest priority audit events that will be logged.
Accepted values are: HIGH, MEDIUM, LOW and NONE.</p> <p>Setting the value to HIGH will result in only HIGH level events being logged. NONE will cause no events to be logged. MEDIUM will only allow events with a priority of MEDIUM and HIGH to be logged.</p> <p>Refer to the levels for the various events.</p> <p>This does not affect events displayed in the Audit log screens for projects and repositories.</p> |
| <code>audit.details.max.length=1024</code> | Defines the number of characters that can be stored as details for a single audit entry. |
| <code>plugin.stash-audit.max.entity.rows=500</code> | <p>The maximum number of entries a project or repository can have in the audit tables.</p> <p>This does not affect the data stored in the logs.</p> |
| <code>plugin.stash-audit.cleanup.batch.size=1000</code> | <p>When trimming the audit entries table this is the maximum number of rows that will be trimmed in one transaction. Reduce this size if you are having issues with long running transactions.</p> <p>This does not affect the data stored in the logs.</p> |
| <code>plugin.stash-audit.cleanup.run.interval=24</code> | <p>How often the audit tables will be checked to see if they need to be trimmed (in hours).</p> <p>This does not affect the data stored in the logs.</p> |

Authentication

See also [Connecting Stash to Crowd](#).

| Property | Description |
|--|---|
| <code>plugin.auth-crowd.sso.enabled=false</code> | Whether Stash support SSO and be enabled or not. Regardless of this setting, SSO authentication will only be activated if a Crowd directory is configured in Stash that supports SSO. |

| | |
|--|--|
| <code>plugin.auth-crowd.sso.session.validationinterval=3</code> | The number of minutes to cache authentication validation for the session. This value can be set to 0, indicating that every HTTP request will require authentication with the Crowd server. |
| <code>plugin.auth-crowd.sso.session.lastvalidation=atl.crowd.sso.lastvalidation</code> | The session key to use when storing Date values for the user's authentication. |
| <code>plugin.auth-crowd.sso.session.tokenkey=atl.crowd.sso.tokenkey</code> | The session key to use when storing String values for the user's authentication token. |
| <code>plugin.auth-crowd.sso.session.validationinterval=3</code> | The number of minutes to cache authentication validation for the session. This value can be set to 0, indicating that every HTTP request will be validated by the Crowd server for every HTTP request. |
| <code>plugin.auth-crowd.sso.http.max.connections=20</code> | The maximum number of HTTP connections in the connection pool for communicating with the Crowd server. |

| | |
|--|--|
| plugin.auth-crowd.sso.http.proxy.host | The name the proxy server uses to transport SOAP traffic to the Crowd server. |
| plugin.auth-crowd.sso.http.proxy.port | The connection port of the proxy server (must be specified in proxy host if specified). |
| plugin.auth-crowd.sso.http.proxy.username | The user used to authenticate with the proxy server (if the proxy server requires authentication). |
| plugin.auth-crowd.sso.http.proxy.password | The password used to authenticate with the proxy server (if the proxy server requires authentication). |
| plugin.auth-crowd.sso.http.timeout=5000 | The HTTP connection timeout in milliseconds used for communicating with the Crowd server. A value of zero indicates that there is no connection timeout. |
| plugin.auth-crowd.sso.socket.timeout=20000 | The socket timeout in milliseconds. You may want to override the default value if the latency to the Crowd server is high. |

Avatars

| Property | Description |
|---|--|
| avatar.gravatar.default=mm | <p>The fallback URL for Gravatar avatars when a user does not have an acceptable avatar configured. This may be a URL resource, or a Gravatar provided default set.</p> <p>This configuration setting is DEPRECATED. It will be removed in Stash 3.0. Use <code>avatar.url.default</code> instead.</p> |
| avatar.max.dimension=1024 | <p>Controls the max height <i>and</i> width for an avatar image. Even if the avatar is within the acceptable file size, if its dimensions exceed this value for height or width, it will be rejected.</p> <p>When an avatar is loaded by the server for processing, images with large dimensions may expand from as small as a few kilobytes on disk to consume a substantially larger amount of memory, depending on how well the image data was compressed. Increasing this limit <i>substantially</i> increase the amount of memory used while processing avatars and may result in <code>OutOfMemoryErrors</code>.</p> <p>Value is in PIXELS.</p> |
| avatar.max.size=1048576 | <p>Controls how large an avatar is allowed to be. Avatars larger than this are rejected and cannot be uploaded to the server, to prevent excessive disk usage.</p> <p>Value is in BYTES.</p> |
| avatar.temporary.cleanup.interval=1800000 | <p>Controls how frequently temporary avatars are cleaned up. Any temporary avatars that have been uploaded are checked against their configured max age and removed from the file system if they are "too old".</p> <p>Value is in MILLISECONDS.</p> |
| avatar.temporary.max.age=30 | <p>Controls how long a temporary avatar that has been uploaded is retained before it is automatically deleted.</p> <p>Value is in MINUTES.</p> |

| | |
|--|---|
| <pre>avatar.url.default=\${avatar.gravatar.default}</pre> | <p>Defines the fallback URL to be formatted into the <code>avatar.url.format.http</code> or <code>avatar.url.format.https</code> URL format for use when a user does not have an acceptable avatar configured. This value may be a URL or, if using Gravatar, it may be the identifier for one of Gravatar's default avatars.</p> <p>The default here falls back on the now-deprecated <code>avatar.gravatar.default</code> setting, which should ensure the value, if set, continues to work until it is removed in Stash 3.0. At that time, this default will become "mm".</p> |
| <pre>avatar.url.format.http=http://www.gravatar.com/ avatar/%1\$s.jpg?s=%2\$d&d=%3\$s</pre> | <p>Defines the default URL format for retrieving user avatars over HTTP. This default uses any G-rated avatar provided by the Gravatar service [http://www.gravatar.com]</p> <p>The following format parameters are available:</p> <ul style="list-style-type: none"> <code>%1\$s</code> – the user's e-mail address, MD5 hashed, or "00000000000000000000000000000000" if the user has no e-mail. <code>%2\$d</code> – the requested avatar size. <code>%3\$s</code> – the fallback URL, URL-encoded which may be defined using "avatar.url.default". <code>%4\$s</code> – the user's e-mail address, not hashed, or an empty string if the user has no e-mail. |
| <pre>avatar.url.format.https=https://secure.gravatar.com/ avatar/%1\$s.jpg?s=%2\$d&d=%3\$s</pre> | <p>Defines the default URL format for retrieving user avatars over HTTPS. This default uses any G-rated avatar provided by the Gravatar service [http://www.gravatar.com]</p> <p>The following format parameters are available:</p> <ul style="list-style-type: none"> <code>%1\$s</code> – the user's e-mail address, MD5 hashed, or "00000000000000000000000000000000" if the user has no e-mail. <code>%2\$d</code> – the requested avatar size. <code>%3\$s</code> – the fallback URL, URL-encoded which may be defined using "avatar.url.default". <code>%4\$s</code> – the user's e-mail address, not hashed, or an empty string if the user has no e-mail. |

Backup

| Property | Description |
|----------------------------------|---|
| backup.drain.database.timeout=60 | Defines the number of seconds Stash will wait for connections to the database to drain and latch in preparation for a backup.

Value is in SECONDS. |

Changesets

| Property | Description |
|---------------------------|---|
| changeset.diff.context=10 | Defines the number of context lines to include around diff segments in changeset diffs. |

Changeset indexing

These properties control how changesets are indexed when new commits are pushed to Stash.

| Property | Description |
|---|--|
| indexing.max.threads=2 | Controls the maximum number of threads which are used to perform indexing. The resource limits configured below are not applied to these threads, so using a high number may negatively impact server performance. |
| indexing.job.batch.size=250 | Defines the number of changesets which will be indexed in a single database transaction. |
| indexing.job.queue.size=150 | Defines the maximum number of pending indexing requests. When this limit is reached, attempts to queue another indexing operation will be rejected. |
| indexing.process.timeout.execution=3600 | Controls how long indexing processes are allowed to execute before they are interrupted, even if they are producing output or consuming input.

Value is in SECONDS. |

Commit graph cache

| Property | Description |
|--|---|
| commit.graph.cache.min.free.space=1073741824 | Controls how much space needs to be available on disk (specifically under <Stash home directory>/caches) for caching to be enabled. This setting ensures that the cache plugin does not fill up the disk.

Value is in BYTES. |
| commit.graph.cache.max.threads=2 | Defines the number of threads that will be used to create commit graph cache entries. |

| | |
|---------------------------------------|--|
| commit.graph.cache.max.job.queue=1000 | Defines the maximum number of pending cache creation jobs. |
|---------------------------------------|--|

Database

Database properties allow very specific configuration for your database connection parameters, which are set by Stash during database setup and migration, and allow you to configure a database of your own. We don't expect that you will edit these, except in collaboration with Atlassian Support.

Any other driver must be placed in `WEB-INF/lib` in order to use the associated database.

⚠ Warning: `jdbc.driver` and `jdbc.url` are available to plugins via the `ApplicationPropertiesService`. Some JDBC drivers allow the username and password to be defined in the URL. Because that property is available throughout the system (and will be included in STP support requests), that approach should not be used. The `jdbc.username` and `jdbc.password` properties should be used for these values instead.

If none of the values below are specified in `stash-config.properties`, then a provided HSQL database will be used.

| Property | Description |
|--|--|
| <code>jdbc.driver=org.hsqldb.jdbcDriver</code> | <p>The JDBC driver class that should be used by to the database. The default Stash database is a file-based HSQL database (<code>org.hsqldb.jdbcDriver</code>) storing its data in the <Stash home directory>. Stash currently bundles these other JDBC drivers:</p> <ul style="list-style-type: none"> • <code>org.postgresql.Driver</code> (more info) • <code>com.microsoft.sqlserver.jdbc.SQLServerDriver</code> (more info) • <code>oracle.jdbc.driver.OracleDriver</code> <p>⚠ The JDBC drivers for MySQL are <i>not</i> bundled with Stash (due to licensing restrictions) so you will need to download and install the driver yourself. See the MySQL documentation for directions on installing the driver: Connecting to MySQL</p> |
| <code>jdbc.url=jdbc:hsqldb:\${stash.home}/data/db;shutdown=true</code> | This is the JDBC url that Stash will use to connect to the database. This should include the driver subprotocol (<code>hsqldb</code>), the hostname, port and database name you are connecting to. This string may vary depending on what database you are connecting to. Please seek specific connection details from your database provider. |
| <code>jdbc.user=SA</code> | This is the user that Stash will connect to the database as. The user will need to be able to create and drop tables, indexes, as well as read and write operations on the database schema defined in <code>jdbc.url</code> . |
| <code>jdbc.password=</code> | The password that the user defined by <code>jdbc.user</code> connects with. |
| <code>jdbc.ignoreunsupported=false</code> | Allows using a given database, even though it is UNSUPPORTED. This is not intended to be documented, nor to be used generally. It is here as a mechanism to override the supported databases event that it incorrectly blocks access to a database. |

Database pool

These properties control the database pool. The pool implementation used is BoneCP. Documentation for these settings can be found at: <http://jolbox.com/configuration.html>

To get a feel for how these settings really work in practice, the most relevant classes in BoneCP are:

- com.jolbox.bonecp.BoneCP - creates the partitions, opens initial connections, starts threads.
- com.jolbox.bonecp.BoneCPDataSource - manages the pool, bridge to the DataSource interface.
- com.jolbox.bonecp.PoolWatchThread - handles the connection threshold.

| Property | Description |
|---|--|
| db.pool.acquireIncrement=2 | Defines the number of connections to open in a batch when open connections are almost exhausted for a given partition. |
| db.pool.cache.statements=100 | Defines the number of statements to cache.

If you configure your JDBC driver to use loadbalancing or failover with the Stash server, you may need to set db.pool.cache.statements=0. Please note that Stash does not yet (as of version 2.8) support DB redundancy, and that this configuration change is not supported by Atlassian. |
| db.pool.connection.timeout=15 | Defines the amount of time the system will wait when attempting to open a new connection before throwing an exception. The system may hang, during startup, for the configured number of seconds if the database is unavailable. As a result, the timeout configured here should not be generous.

Value is in SECONDS. |
| db.pool.idle.maxAge=30 | Defines the maximum period of time a connection may be idle before it is closed. Generous values should be used here to prevent creating and destroying many short-lived database connections (which defeats the purpose of pooling).

Value is in MINUTES. |
| db.pool.idle.testInterval=10 | Defines the amount of time a connection may be idle before a test query is executed by the pool. This helps prevent connections from being closed by the database server due to inactivity.

Value is in MINUTES. |
| db.pool.partition.connection.maximum=20 | Defines the maximum number of connections that may be open in a given partition. |
| db.pool.partition.connection.minimum=4 | Defines the minimum number of connections open for a given partition. Each partition will open this many connections on startup. That means db.pool.partition.connection.minimum x db.pool.partition.count = initial connection count. |

| | |
|---|---|
| db.pool.partition.connection.threshold=10 | <p>Defines the threshold as a percentage of the maximum connections that each partition will attempt to keep available at all times. If the number of available connections drops to or below the threshold, acquireIncrement connections will be opened until the partition is above it again.</p> <p>⚠ Warning: Be careful to take this number into account when setting the minimum and maximum counts. For example, if the maximum is 30 and the minimum is 5 and the threshold is 20 (20%), 5 is not 20% of 30, so immediately after it is created the partition will open additional connections to get above the threshold. Effectively, that would mean that the "minimum" per partition is 10 ($5 + 5 \text{ acquireIncrement}$), or 40 connections at all times.</p> |
| db.pool.partition.count=4 | Defines the number of different connection partitions to use. This value is used to decrease lock contention, because each partition locks individually. The recommended setting is 3 or 4, but in servers with heavy load and many short-lived requests, performance may be improved by using a higher value. |
| db.pool.threads=4 | Defines the number of helper threads which will be used by the pool to cleanup and release connections back into the pool. Setting a value of 0 disables this feature, which means the executing thread will perform cleanup and release itself. A non-zero value results in a pool of helpers which process connections out of a holding queue. When a thread "closes" a connection, that thread is allowed to continue executing and the connection is placed in the queue. One of the helper threads then performs final cleanup to prepare the connection to be returned to the pool. |

Downloads

| Property | Description |
|--------------------------------|---|
| http.download.raw.policy=Smart | <p>Controls the download policy for raw content.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> Insecure – allows all file types to be viewed in the browser. Secure – requires all file types to be downloaded rather than viewed in the browser. Smart – forces "dangerous" file types to be downloaded, rather than allowing them to be viewed in the browser. <p>These options are case-sensitive and defined in com.atlassian.http.mime.DownloadPolicy.</p> |

Events

These properties control the number of threads that are used for dispatching asynchronous events. Setting this number too high can decrease overall throughput when the system is under high load because of the additional overhead of context switching. Configuring too few threads for event dispatching can lead to events being queued up, thereby reducing throughput. These defaults scale the number of dispatcher threads with the number of available cpu cores.

| Property | Description |
|---------------------------------------|---|
| event.dispatcher.core.threads=0.8*cpu | The minimum number of threads that is available to the event dispatcher. The <code>cpu</code> variable is resolved to the number of cpus that are available. |
| event.dispatcher.max.threads=cpu | The maximum number of event dispatcher threads. The number of dispatcher threads will only be increased when the event queue is full and <code>max.threads</code> has not been reached yet. |
| event.dispatcher.queue.size=4096 | The number of events that can be queued. When the queue is full and no more threads can be created to handle the events, events will be discarded. |
| event.dispatcher.keepAlive=60 | The time a dispatcher thread will be kept alive when the queue is empty and more than <code>core.threads</code> threads are running.
Value is in SECONDS. |

Executor

Controls the thread pool that is made available to plugins for asynchronous processing.

| Property | Description |
|---------------------------|--|
| executor.max.threads=100 | Specifies the maximum number of threads in the thread pool. When more threads are required than the configured maximum, the thread attempting to schedule an asynchronous task to be executed will block until a thread in the pool becomes available. |
| executor.keepAliveTime=60 | Controls how long idle threads are kept alive. Threads idle for more than this time will be terminated.
Value is in SECONDS and must be ≥ 1 . If 0 or a negative value is used, a default value of 1 will be configured. |

Features

Feature properties control high-level system features, allowing them to be disabled for the entire instance. Features that are disabled at this level are disabled *completely*. This means that instance-level configuration for a feature is overridden. It also means that a user's permissions are irrelevant; a feature is still disabled even if the user has the `SYS_ADMIN` permission.

| Property | Description |
|----------|-------------|
| | |

| | |
|--|--|
| <code>attachment.upload.max.size=10</code> | Controls the file size limit for individual attachments to pull request comments and descriptions.

Value is in MB. |
| <code>feature.attachments=true</code> | Controls whether attachments can be added to pull request comments and descriptions. |
| <code>feature.auth.captcha=true</code> | Controls whether to require CAPTCHA verification when the number of failed logins is exceeded. If enabled, any client who has exceeded the number of failed logins allowed using either the Stash web interface or the Git hosting interface will be required to authenticate in the Stash web interface and successfully submit a CAPTCHA before continuing. Setting this to <code>false</code> will remove this restriction and allow users to incorrectly authenticate as many times as they like without penalty.

⚠ Warning: It is STRONGLY recommended you keep this setting enabled. Disabling it will have the following ramifications: <ul style="list-style-type: none"> Your users may lock themselves out of any underlying user directory service (LDAP, Active Directory etc) because Stash will pass through all authentication requests (regardless of the number of previous failures) to the underlying directory service. For Stash installations where you use Stash for user management or where you use a directory service with no limit on the number of failed logins before locking out users, you will open Stash or the directory service up to brute-force password attacks. |
| <code>feature.forks=true</code> | Controls whether repositories can be forked. This setting <i>supersedes and overrides</i> instance-level configuration.

If this is set to <code>false</code> , even repositories which are marked as forkable cannot be forked. |
| <code>feature.personal.repos=true</code> | Controls whether personal repositories can be created.

When set to <code>false</code> , personal repository creation is disabled globally in Stash. |
| <code>feature.public.access=true</code> | Public access to Stash allows unauthenticated users to be granted access to projects and repositories for specific read operations including cloning and browsing repositories. This is normally controlled by project and repository administrators but can be switched off system wide by setting this property to <code>false</code> . This can be useful in highly sensitive environments. |

Hibernate

| Property | Description |
|---|---|
| <code>hibernate.format_sql=false</code> | When <code>hibernate.show_sql</code> is enabled, this flag controls whether Hibernate will format the output SQL to make it easier to read. |
| <code>hibernate.jdbc.batch_size=20</code> | Controls Hibernate's JDBC batching limit, which is used to make bulk processing more efficient (both for processing and for memory usage). |

| | |
|---------------------------------------|--|
| <code>hibernate.show_sql=false</code> | Used to enable Hibernate SQL logging, which may be useful in debugging database issues. This value should generally only be set by developers. |
|---------------------------------------|--|

JIRA

| Property | Description |
|---|--|
| <code>plugin.jira-integration.pullrequest.attribute.changesets.max=100</code> | Controls the maximum number of changesets to retrieve when retrieving attributes associated with changesets of a pull-request. This value should be between 50 and 1000 as Stash will enforce a lower bound of 50 issues and an upper bound of 1000 issues. |
| <code>plugin.jira-integration.remote.page.max.issues=20</code> | Controls the maximum number of issues to request from JIRA. This value should be between 5 and 50 as Stash will enforce a lower bound of 5 issues and an upper bound of 50 issues. |
| <code>plugin.jira-integration.remote.timeout.connection=5000</code> | <p>The connection timeout duration in milliseconds for requests to JIRA. This timeout occurs if the JIRA server does not answer. e.g. the server has been shut down. This value should be between 2000 and 60000 as Stash will enforce a lower bound of 2000ms and an upper bound of 60000ms.</p> <p>Value is in MILLISECONDS.</p> |

| | |
|---|---|
| plugin.jira-integration.remote.timeout.socket=10000 | The socket timeout duration in milliseconds for requests to JIRA. This timeout occurs if the connection to JIRA has been stalled or broken. This value should be between 2000 and 60000 as Stash will enforce a lower bound of 2000ms and an upper bound of 60000ms.

Value is in MILLISECONDS. |
|---|---|

Liquibase

| Property | Description |
|-----------------------------------|--|
| liquibase.commit.block.size=10000 | The maximum number of changes executed against a particular Liquibase database before a commit operation is performed. Very large values may cause DBMS to use excessive amounts of memory when operating within transaction boundaries. If the value of this property is less than one, then changes will not be committed until the end of the change set. |

Logging

Logging levels for any number of loggers can be set in the `stash-config.properties` file using the following format:

```
logging.logger.<name>=<level>
```

For example, to configure all classes in the `com.atlassian.stash` package to DEBUG level:

```
logging.logger.com.atlassian.stash=DEBUG
```

To adjust the ROOT logger, you use the special name ROOT (case-sensitive):

```
logging.logger.ROOT=INFO
```

Notifications

| Property | Description |
|--|--|
| plugin.stash-notification.batch.min.wait.minutes=10 | Controls the minimum time to wait for new notifications before sending the batch. This is the inactivity timeout.

Value is in MINUTES. |
| plugin.stash-notification.batch.max.wait.minutes=30 | Controls the maximum time to wait for new notifications before sending the batch. This is the staleness timeout.

Value is in MINUTES. |
| plugin.stash-notification.mail.max.comment.size=2048 | Controls the maximum allowed size of a single comment in characters (not bytes). Extra characters will be truncated. |
| plugin.stash-notification.mail.max.description.size=2048 | Controls the maximum allowed size of a single description in characters (not bytes). Extra characters will be truncated. |
| plugin.stash-notification.mentions.enabled=true | Controls whether mentions are enabled. |
| plugin.stash-notification.max.mentions=200 | Controls the maximum number of allowed mentions in a single comment. |
| plugin.stash-notification.sendmode.default=BATCHED | Controls the system default for notifications batching for users who have not set an explicit preference.

Value is either BATCHED or IMMEDIATE. |

Paging

These properties control the maximum number of objects which may be returned on a page, regardless of how many were actually requested by the user. For example, if a user requests Integer.MAX_INT branches on a page, their request will be limited to the value set for `page.max.branches`.

This is intended as a safeguard to prevent enormous requests from tying up the server for extended periods of time and then generating responses whose payload is prohibitively large. The defaults configured here represent a sane baseline, but may be overridden if necessary.

| Property | Description |
|-------------------------------------|--------------------------------------|
| <code>page.max.branches=1000</code> | Maximum number of branches per page. |

| | |
|--|--|
| page.max.changes=1000 | Maximum number of changes per page. Unlike other page limits, this is a hard limit; subsequent pages cannot be requested when the number of changes in a changeset exceeds this size. |
| page.max.changesets=100 | Maximum number of changesets (commits) per page. |
| page.max.diff.lines=10000 | Maximum number of segment lines (of any type, total) which may be returned for a single diff. Unlike other page limits, this is a hard limit; subsequent pages cannot be requested when a diff exceeds this size. |
| page.max.directory.children=500 | Maximum number of directory entries which may be returned for a given directory. |
| page.max.directory.recursive.children=100000 | Maximum number of file entries which may be returned for a recursive listing of a directory. A relatively high number as this is used by the file finder which needs to load the tree of files upfront. |
| page.max.groups=1000 | Maximum number of groups per page. |
| page.max.index.results=50 | Maximum number of changesets which may be returned from the index when querying by an indexed attribute. For example, this limits the number of changesets which may be returned when looking up commits against a JIRA issue. |
| page.max.projects=1000 | Maximum number of projects per page. |
| page.max.repositories=1000 | Maximum number of repositories per page. |
| page.max.source.length=5000 | Maximum length for any line returned from a given file when viewing source. This value truncates long lines. There is no mechanism for retrieving the truncated part short of downloading the entire file. |
| page.max.source.lines=5000 | Maximum number of lines which may be returned from a given file when viewing source. This value breaks large files into multiple pages. |
| page.max.tags=1000 | Maximum number of tags per page. |
| page.max.users=1000 | Maximum number of users per page. |
| page.scan.pullrequest.activity.size=500 | The size of the page Stash should use when scanning activities. |
| page.scan.pullrequest.activity.count=4 | The number of pages of activities Stash should scan before giving up. |

Password reset

| Property | Description |
|--|---|
| <code>password.reset.validity.period=4320</code> | Controls how long a password reset token remains valid for. Default period is 72 hours.
Value is in MINUTES. |

Process execution

| Property | Description |
|--|---|
| <code>process.timeout.execution=120</code>
<code>process.timeout.idle=60</code> | Controls timeouts for external processes, such as Git and Hg. The idle timeout configures how long the command is allowed to run without producing any output. The execution timeout configures a hard upper limit on how long the command is allowed to run even if it is producing output.
Values are in SECONDS. Using 0, or a negative value, disables the timeout completely.
USE AT YOUR OWN RISK! |

Pull requests

| Property | Description |
|---|--|
| <code>plugin.stash-scm-git.pullrequest.merge.strategy.KEY.slug=no-ff</code> | Control the merge strategy for a repository (where <code>KEY</code> and <code>slug</code> is the repository slug). Note that the URL for of a repository is of the following form:
<code>http://<stashdomain>/projects/<PROJECTKEY>/repos/<slug></code>
Overrides project and global settings.
Possible values are: <ul style="list-style-type: none">• <code>no-ff</code> – no fast-forward; the default setting.• <code>ff</code> – allow fast-forward; will merge when necessary.• <code>ff-only</code> – require fast-forward; will never create <code>rr</code> if a merge is required.• <code>squash</code> – collapse all incoming commits into a single commit to the target branch; never create a merge.• <code>squash-ff-only</code> – collapse all the incoming commits directly to the target branch, never creating <code>only</code> if the source branch is fast-forward. |
| <code>plugin.stash-scm-git.pullrequest.merge.strategy.KEY=no-ff</code> | Control the merge strategy for a project (where <code>KEY</code> is the project key). Overrides global settings. Is overridden by repository settings.
Possible values are listed above. |
| <code>plugin.stash-scm-git.pullrequest.merge.strategy=no-ff</code> | Control the merge strategy globally. Is overridden by repository settings.
Possible values are listed above. |

| | |
|---|---|
| <code>pullrequest.diff.context=10</code> | Defines the number of context lines to include around changes in request diffs. By default, Git only includes 3 lines. The configuration option and include a bit more useful context around changes, so "expand" the context is implemented. |
| <code>pullrequest.rescope.changesets.display=5</code> | Defines the maximum number of changesets per type (added or removed) to display in a rescope activity. |
| <code>pullrequest.rescope.changesets.max=1000</code> | Defines the absolute maximum number of changesets that will be evaluated when attempting to determine, for a given repository, which changesets were added to or removed from a pull request. Adjusting this setting can have significant memory impact on the system. It is not recommended to be changed, but this option is provided here to support unique use cases. |
| <code>pullrequest.rescope.detail.threads=2</code> | Defines the maximum number of threads to use for pre-rescoping details. These threads perform the requisite processing to determine the commits added and removed when a pull request is rescoped, where most rescopes do not add or remove "dead" rescopes are deleted during processing. The primary purpose is to ensure all details have already been calculated when updating a pull request's overview. |
| <code>pullrequest.rescope.drift.threads=4</code> | Defines the maximum number of threads to use when performing comment drift for a pull request during rescope. Higher values <i>not necessarily mean higher throughput!</i> Performing too many merges can usually force a new merge to be created, which can be slow. Having a substantial number of merges running at the same time can significantly <i>reduce</i> the speed of performing comment drift. |

Readme parsing

| Property | Description |
|---|--|
| <code>plugin.stash-readme.max.size=65536</code> | Controls the maximum allowed size of a readme file to parse.
Value is in BYTES. |

Ref metadata

| Property | Description |
|---|---|
| <code>ref.metadata.timeout=2</code> | Controls timeouts for retrieving metadata associated with a collection of refs from all metadata providers collectively.
This value is in SECONDS. |
| <code>ref.metadata.max.request.count=100</code> | Controls the maximum number of refs that can be used in a metadata query. |

Resource throttling

These properties define concurrent task limits for the ThrottleService, limiting the number of concurrent Git operations of a given type that may be run at once. This is intended to help prevent Stash from overwhelming a server machine with

running processes. Stash has two settings to control the number of Git processes that are allowed to process in parallel: one for the web UI and one for the 'hosting' operations (pushing and pulling commits, and cloning a repository).

When the limit is reached for the given resource, the request will wait until a currently running request has completed. If no request completes within a configurable timeout, the request will be rejected.

When requests while accessing the Stash UI are rejected, users will see either a 501 error page indicating the server is under load, or a popup indicating part of the current page failed.

When Git client 'hosting' commands (pull/push/clone) are rejected, Stash does a number of things:

- Stash will return an error message to the client which the user will see on the command line: "Stash is currently under heavy load and is not able to service your request. Please wait briefly and try your request again"
- A warning message will be logged for every time a request is rejected due to the resource limits, as per the following format:
"A [scm-hosting] ticket could not be acquired (12/12)"
- For five minutes after a request is rejected, Stash will display a red banner in the UI to warn that the server is under load.

The hard, machine-level limits these are intended to prevent hitting are very OS- and hardware-dependent, so you may

need to tune them for your instance of Stash. When hyperthreading is enabled for the server CPU, for example, it is likely that the server will allow sufficient concurrent Git operations to completely bury the I/O on the machine. In such cases, we recommend starting off with a less aggressive default on multi-cored machines – the value can be increased later if hosting operations begin to back up. These defaults are finger-in-the-wind guesstimates (which so far have worked well).

Additional resource types may be configured by defining a key with the format `throttle.resource.<resource-name>`.

When adding new types, it is strongly recommended to configure their ticket counts explicitly using this approach.

| Property | Description |
|--|---|
| <code>throttle.resource.scm-command=25</code> | Limits the number of operations that support the UI , such as <code>git diff</code> , <code>git blame</code> , or <code>git rev-list</code> , that can run concurrently. This is intended to prevent these SCM commands from competing with the running of push and pull operations. |
| <code>throttle.resource.scm-command.timeout=2</code> | Controls how long threads will wait for SCM commands to complete when the system is already running the maximum number of SCM commands.
Value is in SECONDS. |
| <code>throttle.resource.scm-hosting=1.5*cpu</code> | Limits the number of SCM 'hosting' operations, such as <code>git clone</code> , <code>git push</code> and <code>git pull</code> over HTTP or SSH that may be running concurrently. This is intended primarily to prevent pulls, which can be very memory-intensive, from pinning a server's resources. There is limited support for mathematical expressions; <code>+-,*,\()</code> are supported. You can also use the <code>cpu</code> variable which is resolved to the number of cpus that are available. |

| | |
|---|---|
| throttle.resource.scm-hosting.timeout=300 | Controls how long threads will wait for SCM hosting operations to complete when the system is already running the maximum number of SCM hosting operations.

Value is in SECONDS. |
| throttle.resource.busy.message.timeout=5 | Controls how long a warning banner is displayed in the UI after a request is rejected due to excessive load.

Value is in MINUTES. Using 0, or a negative value, disables displaying the banner.
This is deprecated and replaced by <code>server.busy.on.ticket.rejected.within</code> , It is due to be removed in Stash 3.0. |

SCM – Cache

See [Scaling Stash for Continuous Integration performance](#) for more information about using the SCM Cache Plugin for Stash.

| Property | Description |
|---|---|
| <code>plugin.stash-scm-cache.expiry.check.interval=300</code> | Controls how frequently expired caches are checked and deleted from disk.

Value is in SECONDS. |
| <code>plugin.stash-scm-cache.minimum.free.space=1073741824</code> | Controls how much space needs to be available on disk (specifically under <code><Stash home directory>/caches</code>) for caching to be enabled. This setting ensures that the cache plugin does not fill up the disk.

Value is in BYTES. |
| <code>plugin.stash-scm-cache.protocols=HTTP,SSH</code> | Controls which protocols caching is applied to. The <code>HTTP</code> value encapsulates both <code>http</code> and <code>https</code> . |
| <code>plugin.stash-scm-cache.refs.enabled=false</code> | Controls whether ref advertisement operations are cached. |
| <code>plugin.stash-scm-cache.refs.ttl=60</code> | Controls how long the caches for ref advertisements are kept around when there no changes to the repository.

Caches are automatically invalidated when someone pushes to a repository or when a pull request is merged.

Time is in SECONDS. |
| <code>plugin.stash-scm-cache.upload-pack.enabled=true</code> | Controls whether clone operations are cached. |

| | |
|---|--|
| <code>plugin.stash-scm-cache.upload-pack.ttl=14400</code> | <p>Controls how long the caches for clone operations are kept around when there are no changes to the repository.</p> <p>Caches are automatically invalidated when someone pushes to a repository or when a pull request is merged.</p> <p>Time is in SECONDS.</p> |
|---|--|

SCM – Git

| Property | Description |
|---|--|
| <code>plugin.stash-scm-git.path.executable=git</code> | <p>Defines the default path to the Windows machines, the .exe's configured value automatically general, "git" should be an acc platform, here, assuming that it is in the runtime user's PATH.</p> <p>With the new path searching performed by DefaultGitBinaryHelper, setting this is unnecessary, as the plugin will find the executable. This is left here purely for documentation purposes.</p> |
| <code>plugin.stash-scm-git.path.libexec=</code> | Defines the path to the Git library (the git-core directory). This path is used for forked processes. If this value is set, it will be used for forked processes. This eliminates the need for specifying the full path (git -> git-http-backend) and makes the configuration more concise. |
| <code>plugin.stash-scm-git.backend.http.buffer.size=32768</code> | Defines the buffer size in bytes for marshaling data between the C and Java code. |
| <code>plugin.stash-scm-git.backend.ssh.buffer.size=32768</code> | Defines the buffer size in bytes for marshaling data between the C and Java code. |
| <code>plugin.stash-scm-git.backend.timeout.idle=1800</code> | <p>Defines the idle timeout for pushing. It applies a limit to how long the operation can execute without either producing output or receiving input. The default value is 30 minutes.</p> <p>This value is in SECONDS.</p> |
| <code>plugin.stash-scm-git.backend.timeout.execution=86400</code> | <p>Defines the execution timeout for pulling, applying a hard limit to how long it can run even if it is producing output. The default value is 1 day.</p> <p>This value is in SECONDS.</p> |

| | |
|---|---|
| <pre>plugin.stash-scm-git.diff.renames=copies</pre> | <p>Defines whether copy and/or rename is performed. By default, both rename and copy are performed. Only files modified in the source branch are considered as rename or copy overhead.</p> <p>The possible settings are:</p> <ul style="list-style-type: none"> copy or copies – applies copy detection rename or renames – applies rename detection off – disables rename and copy detection <p>When using copy or copies, suffixes can be added with a "+" to use --filter. This setting should be used with care as it is expensive. It considers every file even files not modified in the source branch for copies.</p> <p>When copy and/or rename detection is enabled, stash-scm-git.diff.renames.threshold can be used to control the similarity index required for a copy or rename.</p> |
| <pre>plugin.stash-scm-git.diff.renames.threshold=50</pre> | <p>Defines the threshold, as a percentage of similarity detected as a rename or a copy. The threshold is applied if copy and/or rename detection is enabled (the default threshold applied is 50% of the similarity index itself).</p> <p>Git diff and Git diff-tree do not consider the threshold. They ignore the threshold and apply the default 50% threshold. A threshold of 100 will be applied if the configured threshold is 0, and a threshold of 1 will be applied if the configured threshold is 1.</p> |
| <pre>plugin.stash-scm-git.environment.variablesize=2000</pre> | <p>Defines the maximum number of environment variables added to a single environment. This is useful for environments running on multiple operating systems (and even cross-platform environments). If different environments on the same operating system have different numbers of environment variables, they apply to the environment variable limit. This is intended to be low enough to work on most platforms out of the box, but still be configurable in case of issues on some platform.</p> |
| <pre>plugin.stash-scm-git.pullrequest.merge.auto.forceadd=false</pre> | <p>Defines whether conflicted files are added to the index using Git add --force. By default, this behaviour is off. However, when merging across branches with different .Gitignore settings, enabling this behaviour allows the system to create a conflicted directory. The common ancestor will be selected as the common ancestor.</p> <p>Note: This value has no effect on pull requests. It is only applied during the merge process for producing a pull request's commit message.</p> |

| | |
|--|--|
| <code>plugin.stash-scm-git.pullrequest.merge.auto.timeout=120</code> | Defines the maximum amount to perform a merge to support allowed to execute or idle. Because generally do not produce output timeout.

This value is in SECONDS. |
| <code>plugin.stash-scm-git.pullrequest.merge.real.timeout=300</code> | Defines the maximum amount to merge a pull request is allowed. Because the commands used output, there is no separate idle timeout.

This value is in SECONDS. |

Server busy banners

| Property | Description |
|--|--|
| <code>server.busy.on.ticket.rejected.within=5</code> | Controls how long a warning banner is displayed in the UI after a request is rejected due to excessive load.

Value is in MINUTES. Using 0, or a negative value, disables displaying the banner. |
| <code>server.busy.on.queue.time=60</code> | Controls how long requests need to be queued before they cause a warning banner to appear.

Value is in SECONDS. Using 0, or a negative value, disables displaying the banner. |

SMTP

| Property | Description |
|---|--|
| <code>mail.timeout.connect=60</code>
<code>mail.timeout.send=60</code> | Controls timeouts for establishing an SMTP connection and sending an e-mail. Shorter timeouts should be applied for when sending test e-mails, as the test occurs in user time. |
| <code>mail.test.timeout.connect=30</code>
<code>mail.test.timeout.send=30</code> | Values are in SECONDS. |
| <code>mail.error.pause.log=300</code> | Controls how frequently logs will go to the standard log file about mail sending errors. All errors are logged to the <code>atlassian-stash-mail.log</code> file, but Stash will periodically log a warning to the standard log file if there are errors sending messages.

Value is in SECONDS. |
| <code>mail.error.pause.retry=5</code> | Controls how long Stash will wait before retrying to send a message if an error occurs.

Value is in SECONDS. |

| | |
|-------------------------------|---|
| mail.threads=1 | Controls the number of threads to use for sending emails. Setting this to a higher value will put greater load on your mail server when Stash generates a lot of emails, but will make Stash clear its internal queue faster. |
| mail.max.message.size=1048576 | Controls the maximum allowed size of a single mail message, which is the sum of the subject and body sizes.
Value is in BYTES. |
| mail.max.queue.size=157286400 | Controls the maximum allowed size for the mail queue (any new message will be rejected if the mail queue reaches that size).
Value is in BYTES. |

SSH command execution

| Property | Description |
|---------------------------------------|--|
| plugin.ssh.command.timeout.idle=86400 | Controls timeouts for all SSH commands, such as those that service Git and hg operations over SSH. The idle timeout configures how long the command is allowed to run without writing any output to the client. For SCM commands, the <code>plugin.*.backend.timeout.idle</code> properties defined above will be applied to the underlying process. The default value is 1 day.
Value is in SECONDS. |

Syntax highlighting

See [Configuring syntax highlighting for file extensions](#) for more information.

Stash only applies syntax highlighting to source files, not to diffs.

| Property | Description |
|---|--|
| syntax.highlighter.<language>.executables=exe1,exe2 | Controls the language highlighter used for a given set of hashbang executables.
The <language> refers to the highlighter key defined by highlight.js. |
| syntax.highlighter.<language>.extensions=ext1,ext2 | Controls the language highlighter used for a given set of file extensions.
The <language> refers to the highlighter key defined by highlight.js. |

Webhooks

See [POST service webhook for Stash](#) for more information.

| Property | Description |
|----------|-------------|
|----------|-------------|

| | |
|--|--|
| plugin.com.atlassian.stash.plugin.hook.threadPoolCoreSize=2 | Core size of thread pool – the default number of concurrent hooks notifications. |
| plugin.com.atlassian.stash.plugin.hook.threadPoolMaxSize=3 | Maximal size of thread pool – the maximum number of concurrent hooks notifications. |
| plugin.com.atlassian.stash.plugin.hook.queueSize=1024 | The maximum size of the queue which holds queued requests that are yet to be sent.

When this size is exceeded the oldest unsent message will be dropped and a warning message logged. |
| plugin.com.atlassian.stash.plugin.hook.connectionTimeout=10000 | Connection timeout for hook request in MILLISECONDS.

When the connection times out a warning message will be logged. |
| plugin.com.atlassian.stash.plugin.hook.changesetsLimit=500 | Limit of maximum count of changesets that will be sent in the POST data for a single ref change. |
| plugin.com.atlassian.stash.plugin.hook.changesLimit=100 | Limit of maximum count of changes for a single changeset in the POST data. |

Proxying and securing Stash

This page provides an overview of some common network topology options for running Stash, including running Stash behind a reverse proxy and securing access to Stash by using HTTPS (HTTP over SSL).

Note that Stash does not need to run behind a web server – it is capable of serving web requests directly using the bundled Tomcat application server. On this page, 'connecting to Stash' really means connecting to Tomcat, which is used to serve Stash content.

On this page:

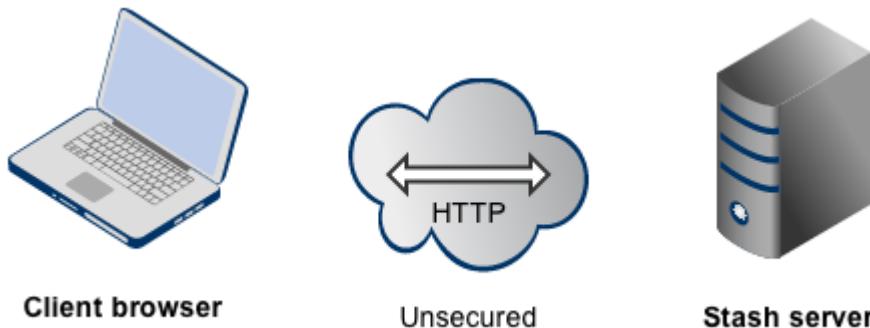

- Connecting to Stash directly over HTTP
- Securing access to Stash using HTTPS
- Using a reverse proxy for Stash
- Securing a reverse proxy using HTTPS

Connecting to Stash directly over HTTP

Connecting directly to Stash (that is, Tomcat) is the default install configuration, as described in the Stash install documentation:

- Getting started

When set up this way, the user accesses Stash directly over HTTP, without using SSL – all communication between the user's browser and Stash will be unsecured.

You may also wish to consider the following:

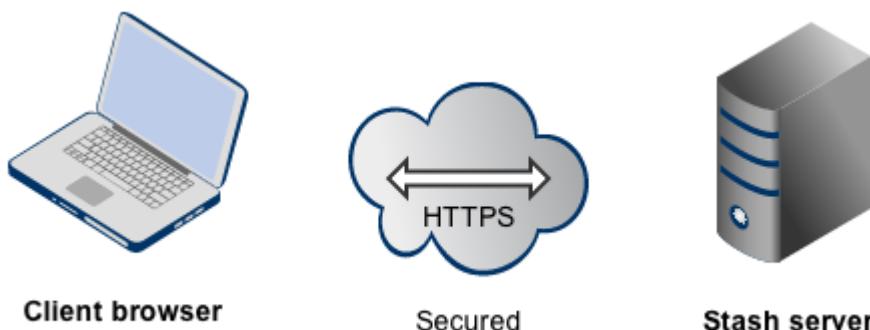

- Stash, by default, will listen for requests on port 7990 – this [port can be changed](#) if required.
- The address with which to access Stash, by default, will be `http://<computer name>:7990`. Change the [base URL for Stash](#) if required.
- You can [set the context path](#) for Stash if you are running another Atlassian application, or Java web application, at the same hostname and context path as Stash.
- Securing Git operations between the user's computer and Stash is a separate consideration - see [Enabling SSH access to Git](#).

Securing access to Stash using HTTPS

Access to Stash can be secured by enabling HTTPS (HTTP over SSL) for the Tomcat application server that is bundled with Stash. You should consider doing this, and making secure access mandatory, if Stash will be internet-facing and usernames, passwords and other proprietary data may be at risk.

When set up in this way, access to Stash is direct, and all communication between the user's browser and Stash will be secured using SSL.

See [Securing Stash with Tomcat using SSL](#) for configuration details.

Note that:

- Stash will listen for requests on port 8443, according to the instructions in [Securing Stash with Tomcat using SSL](#). This port can be changed if required.
- The address with which to access Stash, by default, will be `https://<computer name>:8443`. Change the [base URL for Stash](#) if required.
- Any existing [links with other applications](#) will need to be reconfigured using this new URL for Stash.
- You can [set the context path](#) for Stash if you are running another Atlassian application, or Java web application, at the same hostname and context path as Stash.
- Securing Git operations between the user's computer and Stash is a separate consideration - see [Enabling SSH access to Git](#).

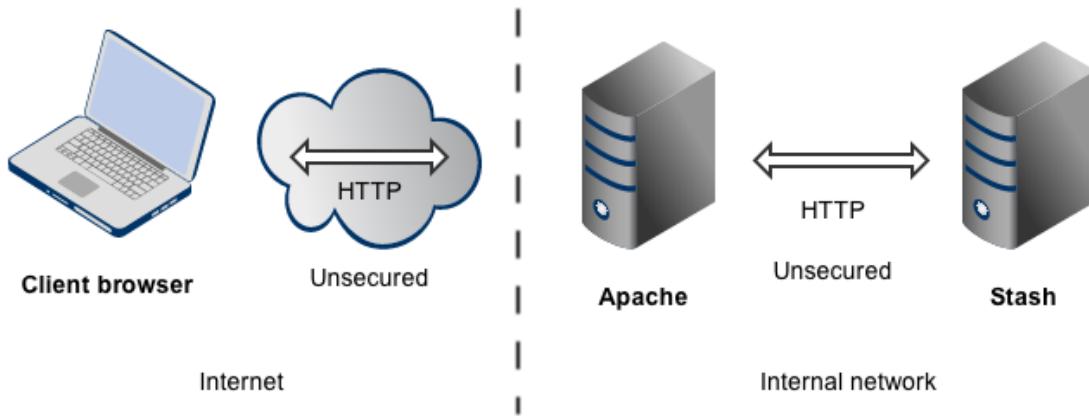

Using a reverse proxy for Stash

You can run Stash behind a reverse proxy, for example Apache HTTP Server. You may wish to do this if you want to:

- use a different port number to access Stash
 - use a different context path to access Stash

When set up this way, external access to Stash is via a reverse proxy, without using SSL. All communication between the user's browser and Apache, and so Stash, will be unsecured, but users do not have direct access to Stash. An example scenario is where Apache provides a gateway through which users outside the firewall can access Stash.

See [Integrating Stash with Apache HTTP Server](#) for configuration details.

Note that:

- Stash, by default, will listen for requests on port 7990 – this port can be changed if required.
 - Stash (Tomcat) needs to know the URL (proxy name) that Apache serves.
 - The address with which to access Stash will be `http://<proxy name>:7990`. Change the [base URL](#) for Stash if required.
 - Any existing [links with other applications](#) will need to be reconfigured using this new URL for Stash.
 - You can [set the context path](#) for Stash if you are running another Atlassian application, or Java web application, at the same hostname and context path as Stash.
 - Securing Git operations between the user's computer and Stash is a separate consideration - see [Enabling SSH access to Git](#).

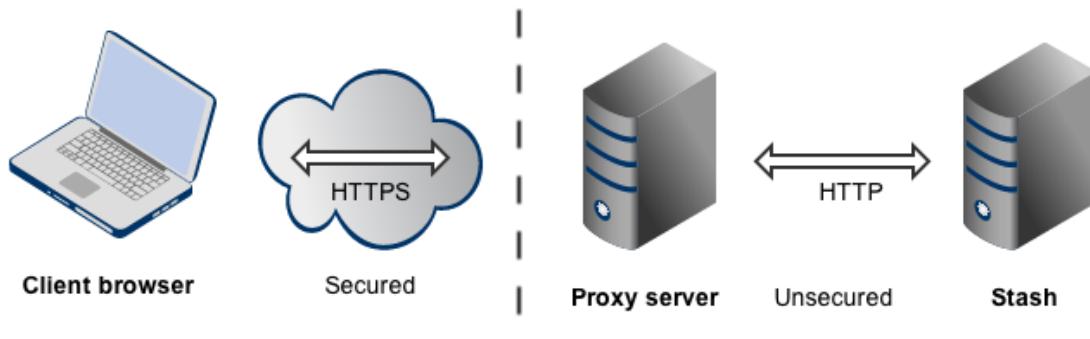

Securing a reverse proxy using HTTPS

You can run Stash behind a reverse proxy, such as Apache HTTP Server or nginx, that is secured using HTTPS (HTTP over SSL). You should consider doing this, and making secure access mandatory, if usernames, passwords and other proprietary data may be at risk. An example scenario is where Apache HTTP Server provides a gateway through which users outside the firewall can access Stash.

When set up in this way, external access to Stash is via a reverse proxy, where external communication with the proxy uses HTTPS. All communication between the user's browser and the reverse proxy will be secured, whereas communication between the proxy and Stash will not be secured (it doesn't use SSL).

See the following pages for configuration details:

- Securing Stash with Apache using SSL
 - Securing Stash behind nginx using SSL

Note that:

- The reverse proxy (for example, Apache) will listen for requests on port 443.
- Stash, by default, will listen for requests on port 7990. Stash (Tomcat) needs to know the URL (proxy name) that the proxy serves.
- The address with which to access Stash will be `https://<proxyName>:<proxyPort>/<context path>`, for example <https://mycompany.com:443/stash>
- Any existing [links with other applications](#) will need to be reconfigured using this new URL for Stash.
- Stash (Tomcat) should be configured to refuse requests on port 7990 and to redirect those to the proxy on port 443.
- Securing Git operations between the user's computer and Stash is a separate consideration - see [Enabling SSH access to Git](#).
- It would be possible to set up an SSL connection between the proxy server and Tomcat (Stash), but that configuration is very unusual, and not recommended in most circumstances.
- Incidentally, note that Stash 2.10 and later versions do not support `mod_auth_basic`.

Securing Stash with Tomcat using SSL

This page is intended for administrators setting up Stash for a small team. It describes how to enable HTTPS (HTTP over SSL) access for Tomcat, the webserver distributed with Stash, using a self-signed certificate. You should consider doing this, and making secure access mandatory, if Stash will be internet-facing and usernames, passwords and other proprietary data may be at risk.

If you are setting up a production instance you should consider [using a CA certificate](#), briefly described below.

There are other network topology options for running Stash, including running Stash behind a reverse proxy. For an overview of some common options, see [Proxying and securing Stash](#).

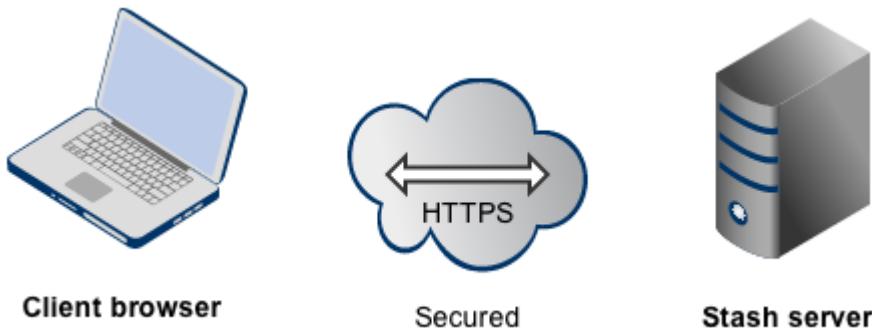

When Stash is set up following the instructions on this page, access to Stash is direct, and all communication between the user's browser and Stash will be secured using SSL.

On this page:

1. Generate a self-signed certificate
 2. Configure HTTPS in Tomcat
- Exporting the self-signed certificate
Requesting a CA certificate
Troubleshooting

Related pages:

- [Integrating Stash with Apache HTTP Server](#)
- [Securing Stash with Apache using SSL](#)

Note that:

- Stash will listen for requests on port 8443, according to the instructions in [Securing Stash with Tomcat using SSL](#). This port can be changed if required.
- The address with which to access Stash, by default, will be <https://<computer name>:8443>. Change the [base URL for Stash](#) if required.
- Any existing [links with other applications](#) will need to be reconfigured using this new URL for Stash.
- You can [set the context path](#) for Stash if you are running another Atlassian application, or Java web application, at the same hostname and context path as Stash.
- Securing Git operations between the user's computer and Stash is a separate consideration - see [Enabling SSH access to Git](#).

⚠️ Please note that Atlassian Support will refer SSL-related support to the issuing authority for the certificate. The documentation on this page is for reference only.

1. Generate a self-signed certificate

Self-signed certificates are useful where you require encryption but do not need to verify the website identity. They are commonly used for testing and on internal corporate networks (intranets).

Users may receive a warning that the site is untrusted and have to "accept" the certificate before they can access the site. This usually will only occur the first time they access the site.

The following approach to creating a certificate uses Java's [keytool](#), for Java 1.6. Other tools for generating certificates are available.

To generate a self-signed certificate:

- Log in with the user account that Stash will run under, and run the following command:

| | |
|------------------------------|--|
| Windows | <code>"%JAVA_HOME%\bin\keytool" -genkey -alias tomcat -keyalg RSA</code> |
| Linux, MacOS and Unix | <code>\$JAVA_HOME/bin/keytool -genkey -alias tomcat -keyalg RSA</code> |

This will create (if it doesn't already exist) a new .keystore file located in the home directory of the user you used to run the keytool command.

Note the following:

- When running the keytool command you will be prompted with: What is your first and last name?

You **must** enter the **fully qualified hostname** of the server running Stash. This is the name you would type in your web browser after 'http://' (no port number) to access your Stash installation. The qualified host name should match the base URL you have set in Stash (without the port number).

- The keytool utility will also prompt you for two passwords: the keystore password and the key password for Tomcat.

You **must** use the same value for both passwords, and the value **must** be either:

- "changeit", which is the default value Tomcat expects, or
- any other value, but you must also specify it in `conf/server.xml` by adding the following attribute to the `<Connector>` tag: `keystorePass="<password value>"`

2. Configure HTTPS in Tomcat

To configure HTTPS in Tomcat:

- Edit `conf/server.xml` and, at the bottom, before the `</Service>` tag, add this section (or uncomment this if it already exists):

```
<Connector port="8443"
    maxHttpHeaderSize="8192"
    SSLEnabled="true"
    maxThreads="150"
    minSpareThreads="25"
    maxSpareThreads="75"
    enableLookups="false"
    disableUploadTimeout="true"
    useBodyEncodingForURI="true"
    acceptCount="100"
    scheme="https"
    secure="true"
    clientAuth="false"
    sslProtocol="TLS" />
```

This enables SSL access on port 8443 (the default for HTTPS is 443, but 8443 is used here instead of 443 to avoid conflicts).

- Comment out the existing Connector directive for port 7990 in `conf/server.xml`, so as to disable HTTP access, if you want all access to Stash to make use of HTTPS. That is, comment out this directive:

```
<Connector port="7990"
    protocol="HTTP/1.1"
    connectionTimeout="20000"
    useBodyEncodingForURI="true"
    redirectPort="8443"
    compression="on"

    compressableMimeType="text/html, text/xml, text/plain, text/css, application/json,
    application/javascript, application/x-javascript" />
```

- Start, or re-start, Stash. You will be able to access Stash at `https://localhost:8443` in your browser.

Exporting the self-signed certificate

If Stash will run as the user who ran the `keytool --genkey` command, *you do not need to export the certificate*.

You may need to export the self-signed certificate, so that you can import it into a different keystore, if Stash will not be run as the user executing `keytool --genkey`. You can do so with the following command:

| | |
|------------------------------|--|
| Windows | "%JAVA_HOME%\bin\keytool" -export -alias tomcat -file file.cer |
| Linux, MacOS and Unix | \$JAVA_HOME/bin/keytool -export -alias tomcat -file file.cer |

If you generate the certificate as one user and run Stash as another, you'll need to do the certificate export as the generating user and the import as the target user.

Requesting a CA certificate

Digital certificates that are issued by trusted 3rd party CAs (Certification Authorities) provide verification that your website does indeed represent your company.

When running Stash in a production environment, you will need a certificate issued by a CA, such as [VeriSign](#), [Thawte](#) or [TrustCenter](#). The instructions below are adapted from the [Tomcat documentation](#).

First, you will generate a local certificate and create a 'certificate signing request' (CSR) based on that certificate. You then submit the CSR to your chosen certificate authority. The CA will use that CSR to generate a certificate for you.

1. Use Java's keytool utility to generate a local certificate, as described in the [section above](#).
2. Use the keytool utility to generate a CSR, replacing the text <MY_KEYSTORE_FILENAME> with the path to and file name of the .keystore file generated for your local certificate:

| | |
|------------------------------|---|
| Windows | "%JAVA_HOME%\bin\keytool" -certreq -keyalg RSA -alias tomcat -file certreq.csr -keystore <MY_KEYSTORE_FILENAME> |
| Linux, MacOS and Unix | \$JAVA_HOME/bin/keytool -certreq -keyalg RSA -alias tomcat -file certreq.csr -keystore <MY_KEYSTORE_FILENAME> |

3. Submit the generated file called certreq.csr to your chosen certificate authority. Refer to the documentation on the CA's website to find out how to do this.
4. The CA will send you a certificate.
5. Import the new certificate into your local keystore. Assuming your certificate is called "file.cer" whether obtained from a CA or self-generated, the following command will add the certificate to the keystore:

| | |
|------------------------------|--|
| Windows | "%JAVA_HOME%\bin\keytool" -import -alias tomcat -file file.cer |
| Linux, MacOS and Unix | \$JAVA_HOME/bin/keytool -import -alias tomcat -file file.cer |

Troubleshooting

Here are some troubleshooting tips if you are using a self-signed key created by keytool, or a CA certificate, as described above.

When you enter "<https://localhost:8443/>" in your browser, if you get a message such as "Cannot establish a connection to the server at localhost:8443", look for error messages in your logs/catalina.out log file. Here are some possible errors with explanations:

SSL + Apache + IE problems

Some people have reported errors when uploading attachments over SSL using IE. This is due to an IE bug, and can be fixed in Apache by setting:

```
BrowserMatch ".MSIE." \
    nokeepalive ssl-unclean-shutdown \
    downgrade-1.0 force-response-1.0
```

Google has plenty more on this.

Can't find the keystore

```
java.io.FileNotFoundException: /home/user/.keystore (No such file or directory)
```

This indicates that Tomcat cannot find the keystore. The keytool utility creates the keystore as a file called `.key` store in the current user's home directory. For Unix/Linux the home directory is likely to be `/home/<username>`. For Windows it is likely to be `C:\User\<UserName>`.

Make sure you are running Stash as the same user who created the keystore. If this is not the case, or if you are running Stash on Windows as a service, you will need to specify where the keystore file is in `conf/server.xml`. Add the following attribute to the connector tag you uncommented:

```
keystoreFile=<location of keystore file>"
```

Incorrect password

```
java.io.IOException: Keystore was tampered with, or password was incorrect
```

You used a different password than "changeit". You must either use "changeit" for both the keystore password and for the key password for Tomcat, or if you want to use a different password, you must specify it using the `keystorePass` attribute of the Connector tag, as described above.

Passwords don't match

```
java.io.IOException: Cannot recover key
```

You specified a different value for the keystore password and the key password for Tomcat. Both passwords must be the same.

Wrong certificate

```
javax.net.ssl.SSLException: No available certificate corresponds to the SSL cipher suites which are enabled.
```

If the Keystore has more than one certificate, Tomcat will use the first returned unless otherwise specified in the SSL Connector in `conf/server.xml`.

Add the `keyAlias` attribute to the Connector tag you uncommented, with the relevant alias, for example:

```
<Connector port="8443"
    maxHttpHeaderSize="8192"
    maxThreads="150"
    minSpareThreads="25"
    maxSpareThreads="75"
    enableLookups="false"
    disableUploadTimeout="true"
    useBodyEncodingForURI="true"
    acceptCount="100"
    scheme="https"
    secure="true"
    clientAuth="false"
    sslProtocol="TLS"
    keystoreFile="/opt/local/.keystore"
    keystorePass="removed"
    keyAlias="tomcat"/>
```

Using Apache Portable Runtime

APR uses a different SSL engine, and you will see an exception like this in your logs

```
SEVERE: Failed to initialize connector [Connector[HTTP/1.1-8443]]
LifecycleException: Protocol handler initialization failed: java.lang.Exception:
No Certificate file specified or invalid file format
```

The reason for this is that the APR Connector uses OpenSSL and cannot use the keystore in the same way.
You can rectify this in one of two ways:

Use the Http11Protocol to handle SSL connections

Edit the server.xml so that the SSL Connector tag you just uncommented specifies the Http11Protocol instead of the APR protocol:

```
<Connector port="8443"
    protocol="org.apache.coyote.http11.Http11Protocol"
    maxHttpHeaderSize="8192"
    SSLEnabled="true"
    keystoreFile="${user.home}/.keystore"
    maxThreads="150"
    enableLookups="false"
    disableUploadTimeout="true"
    acceptCount="100"
    scheme="https"
    secure="true"
    clientAuth="false"
    sslProtocol="TLS"
    useBodyEncodingForURI="true" />
```

Configure the Connector to use the APR protocol

This is only possible if you have PEM encoded certificates and private keys. If you have used OpenSSL to generate your key, then you will have these PEM encoded files - in all other cases contact your certificate provider for assistance.

```
<Connector port="8443"
    maxThreads="200"
    scheme="https"
    secure="true"
    SSLEnabled="true"
    SSLCertificateFile="${user.home}/certificate.pem"
    SSLCertificateKeyFile="${user.home}/key.pem"
    clientAuth="optional"
    SSLProtocol="TLSv1"/>
```

Enabling client authentication

To enable client authentication in Tomcat, ensure that the value of the `clientAuth` attribute in your `Connector` element of your Tomcat's `server.xml` file is `true`.

```
<Connector
    ...
    clientAuth="true"
    ... />
```

For more information about `Connector` element parameters, please refer to the 'SSL Support' section of the [Tomcat 6.0 documentation](#).

Wrong certificate type

If the certificate from the CA is in PKCS12 format, add the `keystoreType` attribute to the SSL Connector in `conf/server.xml`.

```
keystoreFile="/opt/local/wildcard_atlassian_com.p12"
keystorePass="removed"
keystoreType="PKCS12"/>
```

Certificate chain is incomplete

If the root certificate and intermediary certificate(s) aren't imported into the keystore before the entity/domain certificate, you will see the following error:

```
[root@dev atlas]# /usr/java/jdk1.7.0_17/bin/keytool -import -alias
tomcat -file my_entity_cert.crt
Enter keystore password:
keytool error: java.lang.Exception: Failed to establish chain from reply
```

Most likely, the CA sent a compressed file containing several certificates. The import order matters so you must import the root certificate first, followed by one or many intermediate certificates, followed lastly by the entity/domain certificate. There are many resources online that provide guidance for [certificate installation for Tomcat \(Java-based\) web servers using keytool](#).

Integrating Stash with Apache HTTP Server

This page explains how to establish a network topology in which Apache HTTP Server acts as a [reverse proxy](#) for Stash. Typically, such a configuration would be used when Stash is installed in a protected zone 'behind the firewall', and Apache HTTP Server provides a gateway through which users outside the firewall can access Stash. You may wish to do this if you want to:

- use a different port number to access Stash
- use a different context path to access Stash

Be aware that Stash does not need to run behind a web server, since it is capable of serving web requests directly; to secure Stash when run in this way see [Securing Stash with Tomcat using SSL](#). For an overview of other network topology options, see [Proxying and securing Stash](#). Otherwise, if you want to install Stash in an environment that incorporates Apache HTTP Server, this document is for you.

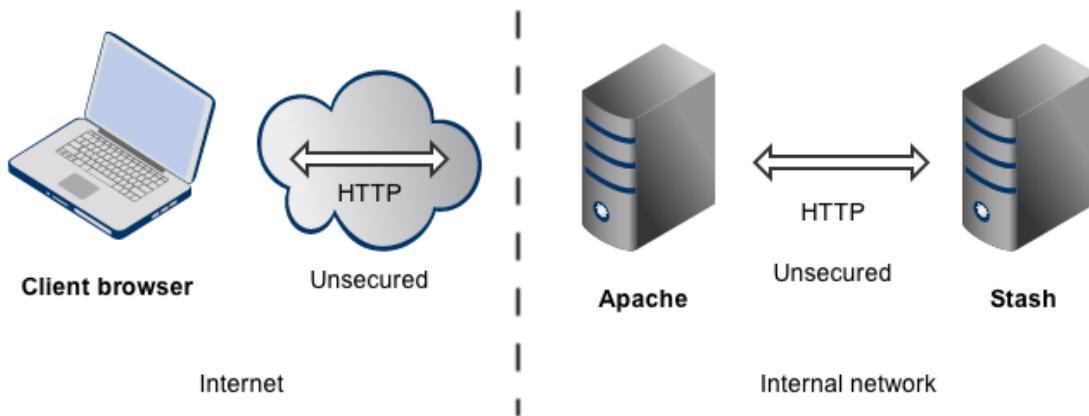

When Stash is set up following the instructions on this page, external access to Stash is via a reverse proxy, without using SSL. All communication between the user's browser and Apache, and so Stash, will be unsecured, but users do not have direct access to Stash.

On this page:

- [About using Apache software](#)
- [Step 1: Configure the Tomcat Connector](#)
- [Step 2: Change Stash's base URL](#)
- [Step 3 \(optional\): Set a context path for Stash](#)
- [Step 4: Enable mod_proxy and mod_proxy_http in Apache HTTP Server](#)
- [Step 5: Configure mod_proxy to map requests to Stash](#)
- [Step 6: Configure mod_proxy to disable forward proxying](#)
- [Step 7: Allow proxying to Stash from everywhere](#)
- [Step 8 \(optional\): Configure Apache HTTP Server for SSL](#)
- [A note about application links](#)
- [Troubleshooting](#)

Related pages:

- [Securing Stash with Apache using SSL](#)
- [Securing Stash with Tomcat using SSL](#)

Note that:

- Stash, by default, will listen for requests on port 7990 – this port can be changed if required.
- Stash (Tomcat) needs to know the URL (proxy name) that Apache serves.
- The address with which to access Stash will be `http://<proxy name>:7990`. Change the [base URL for Stash](#) if required.
- Any existing [links with other applications](#) will need to be reconfigured using this new URL for Stash.
- You can [set the context path for Stash](#) if you are running another Atlassian application, or Java web application, at the same hostname and context path as Stash.
- Securing Git operations between the user's computer and Stash is a separate consideration - see [Enabling SSH access to Git](#).

About using Apache software

This section has general information pertaining to the use of Apache HTTP Server and Apache Tomcat. It is important that you read this section before proceeding to the steps that follow.

Configuring Tomcat 7

The Stash distribution includes an instance of Tomcat 7, the configuration of which is determined by the contents of the `server.xml` file, which can be found in the `conf` directory immediately under the Stash installation

directory. Note that any changes that you make to the `server.xml` file will be effective upon starting or re-starting Stash.

You may find it helpful to refer to the [Apache Tomcat 7.0 Proxy Support HowTo](#) page.

Configuring Apache HTTP Server

 Since Apache HTTP Server is not an Atlassian product, Atlassian does not guarantee to provide support for its configuration. You should consider the material on this page to be for your information only; use it at your own risk. If you encounter problems with configuring Apache HTTP Server, we recommend that you refer to the [Apache HTTP Server Support](#) page.

Note that Stash 2.10 and later versions do not support `mod_auth_basic`.

You may find it helpful to refer to the [Apache HTTP Server Documentation](#), which describes how you can control Apache HTTP Server by changing the contents of the `httpd.conf` file. The section on [Apache Module mod_proxy](#) is particularly relevant. Note that any changes you make to the `httpd.conf` file will be effective upon starting or re-starting Apache HTTP Server.

This document relates to Apache HTTP Server version 2.4.2; the configuration of other versions may differ.

Step 1: Configure the Tomcat Connector

Find the normal (non-SSL) `Connector` directive in Tomcat's `server.xml` file, and add the `scheme`, `proxyName`, and `proxyPort` attributes as shown below. Instead of `mycompany.com`, set the `proxyName` attribute to your domain name that Apache HTTP Server will be configured to serve. This informs Stash of the domain name and port of the requests that reach it via Apache HTTP Server, and is important to the correct operation of the Stash functions that construct URLs.

```
<Connector port="7990"
    protocol="HTTP/1.1"
    connectionTimeout="20000"
    useBodyEncodingForURI="true"
    redirectPort="8443"
    compression="on"

    compressableMimeType="text/html,text/xml,text/plain,text/css,application/json,application/javascript,application/x-javascript"
    scheme="http"
    proxyName="mycompany.com"
    proxyPort="80" />
```

Note: Apache HTTP Server's `ProxyPreserveHost` directive is another way to have the hostname of the incoming request recognised by Stash instead of the hostname at which Stash is actually running. However, the `ProxyPreserveHost` directive does not cause the scheme to be properly set. Since we have to mess with Tomcat's `Connector` directive anyway, we recommend that you stick with the above-described approach, and don't bother to set the `ProxyPreserveHost` in Apache HTTP Server.

For more information about configuring the Tomcat Connector, refer to the [Apache Tomcat 7.0 HTTP Connector Reference](#).

Step 2: Change Stash's base URL

After re-starting Stash, open a browser window and log into Stash using an administrator account. Go to the Stash administration area and click **Server settings** (under 'Settings'), and change **Base URL** to match the proxy URL (the URL that Apache HTTP Server will be serving).

Step 3 (optional): Set a context path for Stash

By default, Stash is configured to run with an empty context path; in other words, from the 'root' of the server's

name space. In that default configuration, Stash is accessed at:

```
http://localhost:7990/
```

It's perfectly fine to run Stash with the empty context path as above. Alternatively, you can set a context path by changing the `Context` directive in Tomcat's `server.xml` file:

```
<Context path="/stash" docBase="${catalina.home}/atlassian-stash"
reloadable="false" useHttpOnly="true">
    ...
</Context>
```

If you do set a context path, it is important that the same path be used in [Step 5](#), when setting up the `ProxyPass` and `ProxyPassReverse` directives. You should also append the context path to Stash's base URL (see [Step 2](#)).

Step 4: Enable `mod_proxy` and `mod_proxy_http` in Apache HTTP Server

In the [mod_proxy](#) documentation, you will read that `mod_proxy` can be used as a forward proxy, or as a reverse proxy (gateway); you want the latter. Where the `mod_proxy` documentation mentions '*origin server*', it refers to your Stash server. Unless you have a good reason for doing otherwise, load `mod_proxy` and `mod_proxy_http` dynamically, using the [LoadModule directive](#); that means un-commenting the following lines in the `httpd.conf` file:

```
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_http_module modules/mod_proxy_http.so
```

Experienced administrators may be aware of the Apache Connector module, `mod_jk`. Atlassian does not recommend use of the `mod_jk` module with Stash, since it has proven itself to be less reliable than `mod_proxy`.

Step 5: Configure `mod_proxy` to map requests to Stash

To configure `mod_proxy` for use with Stash, you need to use the `ProxyPass` and `ProxyPassReverse` directives in Apache HTTP Server's `httpd.conf` file as follows:

```
ProxyPass / http://localhost:7990/ connectiontimeout=5 timeout=300
ProxyPassReverse / http://localhost:7990/
```

Suppose Apache HTTP Server is configured to serve the `mycompany.com` domain; then the above directives tell Apache HTTP Server to forward web requests of the form `http://mycompany.com/*` to the Tomcat connector (Stash) running on port 7990 on the same machine.

The `connectiontimeout` attribute specifies the number of seconds Apache HTTP Server waits for the creation of a connection to Stash.

The `timeout` attribute specifies the number of seconds Apache HTTP Server waits for data to be sent to Stash.

If you set up a context path for Stash in [Step 3](#), you'll need to use that context path in your `ProxyPass` and `ProxyPassReverse` directives. Suppose your context path is set to `"/stash"`, the directives would be as follows:

```
ProxyPass /stash http://localhost:7990/stash connectiontimeout=5 timeout=300
ProxyPassReverse /stash http://localhost:7990/stash
```

If Stash is to run on a different domain and/or different port, you should use that domain and/or port number in the `ProxyPass` and `ProxyPassReverse` directives; for example, suppose that Stash will run on port 9900 on

`private.mycompany.com` under the context path `/stash`, then you would use the following directives:

```
ProxyPass          /stash http://private.mycompany.com:9900/stash connectiontimeout=5
timeout=300
ProxyPassReverse /stash http://private.mycompany.com:9900/stash
```

Step 6: Configure `mod_proxy` to disable forward proxying

If you are using Apache HTTP Server as a reverse proxy only, and not as a forward proxy server, you should turn forward proxying off by including a `ProxyRequests` directive in the `httpd.conf` file, as follows:

```
ProxyRequests Off
```

Step 7: Allow proxying to Stash from everywhere

Strictly speaking, this step is unnecessary because access to proxied resources is unrestricted by default. Nevertheless, we explicitly allow access to Stash from any host so that this policy will be applied regardless of any subsequent changes to access controls at the global level. Use the `Proxy` directive in the `httpd.conf` file as follows:

```
<Proxy *>
    Order Deny,Allow
    Allow from all
</Proxy>
```

The `Proxy` directive provides a context for the directives that are contained within its delimiting tags. In this case, we specify a wild-card url (the asterisk), which applies the two contained directives to all proxied requests.

The `Order` directive controls the order in which any `Allow` and `Deny` directives are applied. In the above configuration, we specify "Deny,Allow", which tells Apache HTTP Server to apply any `Deny` directives first, and if any match, the request is denied unless it also matches an `Allow` directive. In fact, "Deny,Allow" is the default; we include it merely for the sake of clarity. Note that we specify one `Allow` directive, which is described below, and don't specify any `Deny` directives.

The `Allow` directive, in this context, controls which hosts can access Stash via Apache HTTP Server. Here, we specify that all hosts are allowed access to Stash.

Step 8 (optional): Configure Apache HTTP Server for SSL

If you want to set up SSL access to Stash, follow the instructions on [Securing Stash with Apache using SSL](#). When you are finished, users will be able to make secure connections to Apache HTTP Server; connections between Apache HTTP Server and Stash will remain unsecured (not using SSL). If you don't want to set up SSL access, you can skip this section entirely.

Note: It would be possible to set up an SSL connection between Apache HTTP Server and Tomcat (Stash), but that configuration is very unusual, and not recommended in most circumstances.

A note about application links

When an [application link](#) is established between Stash and another Atlassian product (e.g. JIRA), and Stash is operating 'behind' Apache HTTP Server, the link from the other product to Stash must be via the proxy URL; that is, the 'reciprocal URL' from, say JIRA, to Stash must match the proxy name and port that you set at [Step 1](#).

Troubleshooting

- On **Fedora Core 4**, people have reported 'permission denied' errors when trying to get `mod_proxy` (and `mod_jk`) working. Disabling SELinux (`/etc/selinux/config`) apparently fixes this.
- Some users have reported problems with user sessions being hijacked when the `mod_cache` module is enabled. If you have such problems, disable the `mod_cache` module. Note that this module is enabled by

default in some Apache HTTP Server version 2 distributions.

- In general, if you are having problems:

1. Ensure that Stash works as expected when running directly from Tomcat on <http://localhost:7990/stash>.
2. Watch the log files (usually in `/var/log/httpd/` or `/var/log/apache2/`). Check that you have a `LogLevel` directive in your `httpd.conf`, and turn up logging ('`LogLevel debug`') to get more info.
3. Check out the [Stash Knowledge Base](#).

Securing Stash with Apache using SSL

You can run Stash behind a reverse proxy, such as Apache HTTP Server or nginx, that is secured using HTTPS (HTTP over SSL). You should consider doing this, and making secure access mandatory, if usernames, passwords and other proprietary data may be at risk.

There are other network topology options for running Stash; for an overview of some common options, see [Proxying and securing Stash](#).

When Stash is set up following the instructions on this page, external access to Stash is via Apache HTTP Server as a reverse proxy, where external communication with the proxy uses HTTPS. All communication between the user's browser and Apache will be secured, whereas communication between Apache and Stash will not be secured (it doesn't use SSL).

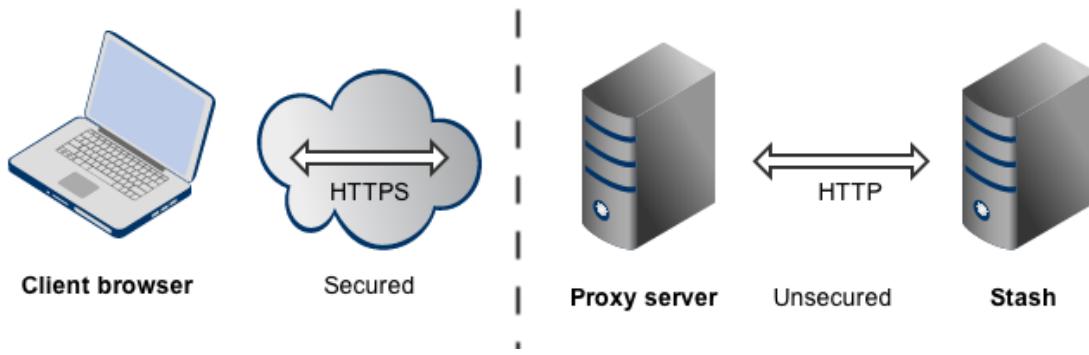

- The steps on this page would normally be performed after integrating Stash with Apache HTTP Server.

On this page:

- Step 1: Configure the Tomcat Connector for SSL
- Step 2: Set up a virtual host in Apache HTTP Server
- Step 3: Create SSL certificate and key files
- Step 4: Update the base URL for 'https'
- Using a self-signed certificate

Related pages:

- [Integrating Stash with Apache HTTP Server](#)
- [Securing Stash with Tomcat using SSL](#)
- [Securing Stash behind nginx using SSL](#)

Note that:

- The reverse proxy (for example, Apache) will listen for requests on port 443.
- Stash, by default, will listen for requests on port 7990. Stash (Tomcat) needs to know the URL (proxy name) that the proxy serves.
- The address with which to access Stash will be `https://<proxyName>:<proxyPort>/<context path>`, for example <https://mycompany.com:443/stash>
- Any existing links with other applications will need to be reconfigured using this new URL for Stash.
- Stash (Tomcat) should be configured to refuse requests on port 7990 and to redirect those to the proxy on port 443.
- Securing Git operations between the user's computer and Stash is a separate consideration - see [Enabling SSH access to Git](#).

- It would be possible to set up an SSL connection between the proxy server and Tomcat (Stash), but that configuration is very unusual, and not recommended in most circumstances.
- Incidentally, note that Stash 2.10 and later versions do not support `mod_auth_basic`.

Step 1: Configure the Tomcat Connector for SSL

Find the normal (non-SSL) Connector directive in Tomcat's `server.xml` file, and change the `redirectPort`, `scheme`, `proxyName` and `proxyPort` attributes as follows:

```
<Connector port="7990"
    protocol="HTTP/1.1"
    connectionTimeout="20000"
    useBodyEncodingForURI="true"
    redirectPort="443"
    compression="on"

compressableMimeType="text/html, text/xml, text/plain, text/css, application/json, application/javascript, application/x-javascript"
    secure="true"
    scheme="https"
    proxyName="mycompany.com"
    proxyPort="443" />
```

The `redirectPort` directive causes Tomcat-initiated redirections to secured resources to use the specified port. Right now, the Stash configuration of Tomcat does not involve Tomcat-initiated redirections, so the change to `redirectPort` is redundant. Nevertheless, we suggest that you change it as directed above for the sake of completeness.

Start, or restart, Stash.

Step 2: Set up a virtual host in Apache HTTP Server

Un-comment the following LoadModule directive in Apache HTTP Server's `httpd.conf` file:

```
LoadModule ssl_module modules/mod_ssl.so
```

Add the following directives to the `httpd.conf` file:

```
Listen 443
<VirtualHost *:443>
    SSLEngine On
    SSLCertificateFile      "/usr/local/apache2/conf/server.crt"
    SSLCertificateKeyFile   "/usr/local/apache2/conf/server.key"
    SSLCertificateChainFile "/usr/local/apache2/conf/server.crt"
    ProxyPass              / http://localhost:7990/ connectiontimeout=5 timeout=300
    ProxyPassReverse        / http://localhost:7990/
</VirtualHost>
```

The `Listen` directive instructs Apache HTTP Server to listen for incoming requests on port 443. Actually, we could omit that directive in this case, since Apache HTTP Server listens for `https` requests on port 443 by default. Nevertheless, it's good to make one's intentions explicit.

The `VirtualHost` directive encloses a number of child directives that apply only and always to requests that arrive at port 443. Since our `VirtualHost` block does not include a `ServerName` directive, it inherits the server name from the main server configuration.

The `SSLEngine` directive toggles the use of the SSL/TLS Protocol Engine. In this case, we're using it to turn SSL on for all requests that arrive at port 443.

The `SSLCertificateFile` directive tells Apache HTTP Server where to find the PEM-encoded certificate file for the server.

The `SSLCertificateKeyFile` directive tells Apache HTTP Server where to find the PEM-encoded private key file corresponding to the certificate file identified by the `SSLCertificateFile` directive. Depending on how the certificate file was generated, it may contain a RSA or DSA private key file, making the `SSLCertificateKeyFile` directive redundant; however, Apache strongly discourages that practice. The recommended approach is to separate the certificate and the private key. If the private key is encrypted, Apache HTTP Server will require a pass phrase to be entered when it starts up.

The `SSLCertificateChainFile` is optional. Please consult with the CA vendor to verify if this is required. This directive sets the optional all-in-one file where you can assemble the certificates of Certification Authorities (CA) which form the certificate chain of the server certificate.

The `ProxyPass` and `ProxyPassReverse` directives should be set up in the manner described in [Step 5](#) of the [Integrating Stash with Apache HTTP Server](#) page. In particular, if Stash is to run on a separate machine from Apache, you should use that domain (and perhaps the port number and context path) in the `ProxyPass` and `ProxyPassReverse` directives.

For more information about the support for SSL in Apache HTTP Server, refer to the [Apache SSL/TLS Encryption](#) manual. In addition, you will find lots of relevant information in the `<apache directory>/conf/extra/httpd-ssl.conf` file, which is included in the standard Apache distribution.

Start, or restart, Apache.

Step 3: Create SSL certificate and key files

In [Step 2](#), you specified `server.crt` and `server.key` as the certificate file and private key file respectively. Those two files must be created before we can proceed. This step assumes that [OpenSSL](#) is installed on your server.

Generate a server key file:

```
openssl genrsa -des3 -out server.key 1024
```

You will be asked to provide a password. Make sure that the password is strong because it will form the one real entry point into the SSL encryption set-up. **Make a note of the password because you'll need it when starting Apache HTTP Server later.**

If you don't wish to specify a password, don't use the `-des3` option in the command above.

Generate a certificate request file (`server.csr`):

```
openssl req -new -key server.key -out server.csr
```

Generate a self-signed certificate (`server.crt`):

```
openssl x509 -req -days 365 -in server.csr -signkey server.key -out server.crt
```

The above command generates a self-signed certificate that is valid for one year. You can use the certificate signing request to purchase a certificate from a [certificate authority](#). For testing purposes though, the self-signed certificate will suffice. Copy the certificate file and private key file to the locations you specified in [Step 2](#).

```
cp server.key /usr/local/apache2/conf/
cp server.crt /usr/local/apache2/conf/
```

Step 4: Update the base URL for 'https'

Open a browser window and log into Stash using an administrator account. Go to the Stash administration area and click **Server settings** (under 'Settings'). Change **Base URL** to use 'https', for example, "https://stash.mycompany.com").

Using a self-signed certificate

There are two implications of using the self-signed certificate:

- When you access Stash in a web browser, you can expect a warning to appear, alerting you that an un-trusted certificate is in use. Before proceeding you will have to indicate to the browser that you trust the certificate.
- When you perform a git clone operation, SSL verification will fail.

The SSL verification error message will look something like this:

```
error:14090086:SSL routines:SSL3_GET_SERVER_CERTIFICATE:certificate verify failed while accessing https://justme@mycompany/git/TP/test.git
```

It's easy to fix. Turn SSL verification off for individual git operations by setting the `GIT_SSL_NO_VERIFY` environment variable. In Unix, you can set the variable in-line with git commands as follows:

```
GIT_SSL_NO_VERIFY=true git clone https://justme@mycompany/git/TP/test.git
```

In Windows you have to set the variable in a separate shell statement:

```
set GIT_SSL_NO_VERIFY=true  
git clone https://justme@mycompany/git/TP/test.git
```

Once you have purchased and installed a signed certificate from a certificate authority, you will no longer have to include the `GIT_SSL_NO_VERIFY` modifier.

Securing Stash behind nginx using SSL

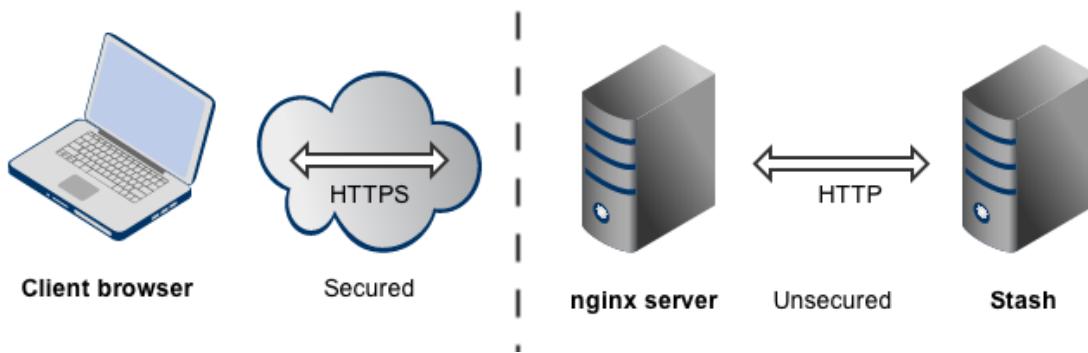

This page describes how to establish a network topology in which the nginx server acts as a [reverse proxy](#) for Stash. Typically, such a configuration would be used when Stash is installed in a protected zone 'behind the firewall', and nginx provides a gateway through which users outside the firewall can access Stash.

The configuration described on this page results in a scenario where:

- External client connections with nginx are secured using SSL. Connections between nginx and Stash are unsecured.
- Stash and nginx run on the same machine.
- Stash is available at <https://mycompany.com:7990/stash>.

On this page:

- Step 1: Configure the Tomcat Connector
- Step 2: Set a context path for Stash
- Step 3: Change Stash's base URL
- Step 4: Configure nginx
- Resources

Please note that:

- We assume that you already have a running instance of nginx. If not, refer to the [nginx documentation](#) for instructions on downloading and installing nginx.
- SSL certificates must be installed on the server machine.
- Any existing [links with other applications](#) will need to be reconfigured using the new URL for Stash.
- Securing Git operations between the user's computer and Stash is a separate consideration - see [Enabling SSH access to Git](#).

Be aware that Stash does not need to run behind a web server, since it is capable of serving web requests directly; to secure Stash when run in this way see [Securing Stash with Tomcat using SSL](#). Otherwise, if you want to install Stash in an environment that incorporates nginx, this document is for you. (You can of course run Stash behind nginx without securing client connections to nginx using SSL – we don't describe this option on this page.)

Note that the [Atlassian Support Offering](#) does not cover nginx integration. Assistance with nginx may be obtained through the Atlassian community from answers.atlassian.com or from an [Atlassian Expert](#).

Step 1: Configure the Tomcat Connector

Find the normal (non-SSL) Connector directive in Tomcat's `server.xml` file, and add the `scheme`, `proxyName`, and `proxyPort` attributes as shown below. Instead of `mycompany.com`, set the `proxyName` attribute to your domain name that the nginx server will be configured to serve. This informs Stash of the domain name and port of the requests that reach it via nginx, and is important to the correct operation of the Stash functions that construct URLs.

```
<Connector port="7990"
    protocol="HTTP/1.1"
    connectionTimeout="20000"
    useBodyEncodingForURI="true"
    redirectPort="443"
    compression="on"

    compressableMimeType="text/html,text/xml,text/plain,text/css,application/json,application/javascript,application/x-javascript"
    secure="true"
    scheme="https"
    proxyName="mycompany.com"
    proxyPort="443" />
```

For more information about configuring the Tomcat Connector, refer to the [Apache Tomcat 7.0 HTTP Connector Reference](#).

Step 2: Set a context path for Stash

By default, Stash is configured to run with an empty context path; in other words, from the 'root' of the server's name space. In that default configuration, Stash would be accessed at:

`http://mycompany.com:7990/`

For the example configuration on this page, we want Stash to be accessed at:

`https://mycompany.com:7990/stash`

In Tomcat's `server.xml` file, set the context path to `/stash`:

```
<Context path="/stash" docBase="${catalina.home}/atlassian-stash"
reloadable="false" useHttpOnly="true">
    ...
</Context>
```

If you use a context path, it is important that the same path is:

- appended to the context path of Stash's base URL ([Step 3](#)).
- used when setting up the location for the `proxy_pass` directive ([Step 4](#)).

Step 3: Change Stash's base URL

After re-starting Stash, open a browser window and log into Stash using an administrator account. Go to the

Stash administration area and click **Server settings** (under 'Settings'), and change **Base URL** to match the proxy URL (the URL that the nginx server will be serving).

For this example, use `http://mycompany.com:7990/stash` (Note the context path with this.)

Step 4: Configure nginx

Edit `/etc/nginx/nginx.conf`, using the example server configuration below, to configure nginx as a proxy server.

Put the `proxy_pass` directive in the location block, and specify the protocol, name and port of the proxied server in the parameter (in our case, it is `http://localhost:7990`):

```
server {  
    listen          443;  
    server_name     mycompany.com;  
  
    ssl             on;  
    ssl_certificate <path/to/your/certificate>;  
    ssl_certificate_key <path/to/your/certificate/key>;  
    ssl_session_timeout 5m;  
    ssl_protocols      SSLv3 TLSv1 TLSv1.1 TLSv1.2;  
    ssl_ciphers        HIGH:!aNULL:!MD5;  
    ssl_prefer_server_ciphers on;  
  
    # Optional optimisation - please refer to  
    # http://nginx.org/en/docs/http/configuring_https_servers.html  
    # ssl_session_cache shared:SSL:10m;  
    location /stash {  
        proxy_pass      http://localhost:7990/stash;  
        proxy_set_header X-Forwarded-Host $host;  
        proxy_set_header X-Forwarded-Server $host;  
        proxy_set_header X-Forwarded-For $proxy_add_x_forwarded_for;  
        proxy_set_header X-Real-IP $remote_addr;  
        proxy_redirect    off;  
    }  
}
```

Refer to http://nginx.org/en/docs/http/ngx_http_proxy_module.html.

Changes made in the configuration file will not be applied until the command to reload configuration is sent to nginx or it is restarted. To reload the configuration, execute:

```
nginx -s reload
```

This command should be executed under the same user that started nginx.

Resources

You may find the following resources helpful in setting up Stash behind nginx:

- http://nginx.org/en/docs/http/configuring_https_servers.html
- <http://www.cyberciti.biz/tips/using-nginx-as-reverse-proxy.html>
- <https://mywushublog.com/2012/08/atlassian-tools-and-nginx/>

Enabling SSH access to Git repositories in Stash

A Stash administrator can enable SSH access to Git repositories in Stash. This allows your Stash users to:

- add their own SSH keys to Stash
- use those SSH keys to secure Git operations between their computer and the Stash server.

Stash users must each [add their own SSH key pairs](#) to their Stash account to be able to use SSH access to repositories.

Supported key types are DSA and RSA2. Note that RSA1 is not supported. We've tested key sizes of 768, 1024, 2048, 4096 and 8192 bytes.

On this page:

- [Enabling SSH access](#)
- [SSH base URL](#)
- [When running Stash behind a proxy](#)

Related pages:

- [Setting up SSH port forwarding](#)
- [Creating SSH keys](#)

Performance

There are performance implications for Stash when using SSH. When users connect to Stash using SSH, the encryption of data adds to overall CPU usage. For day-to-day push and pull operations the overhead will not be significant, but when cloning repositories the overhead will be noticeable.

To get the maximum performance from Stash, we advise configuring automatic build tools to use the http or https protocol, if possible. See [Scaling Stash](#) for more information.

Security

To implement SSH authentication support, Stash bundles a version of the [Apache Mina SSSD server](#). Stash's SSH server is not integrated with the SSH server on the host Stash is running on nor does it consider the users on the host when authenticating Stash users. To prevent security issues, the embedded SSH server has been locked down to allow execution of a small set of commands for Git hosting. The only commands that are supported are `git upload-pack`, `git receive-pack`, `git archive-pack` and `whoami` (a custom `whoami` implemented in Stash not the `whoami` command that exists on Linux). It is not possible to open an SSH shell using the embedded server to execute arbitrary commands on the server.

Enabling SSH access

To enable SSH access:

1. Go to the Stash administration area and click **Server settings** (under 'Settings').
2. Under 'SSH access', check **SSH enabled**.
3. Enter values for **SSH port** and **SSH base URL**, according the information in the sections below.
4. Click **Save**.

SSH base URL

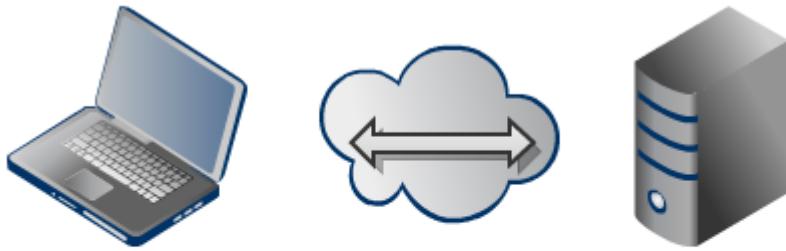

The **SSH base URL** is the base URL with which users can access the SSH push/pull/clone functionality of Stash.

This is the base URL that Stash will use when displaying SSH URLs to users. If you do not set this, it will default to the host that is set in **Stash base URL**, with the port that SSH is listening on. See [Specifying the base URL for Stash](#).

 For example, if the **SSH base URL** is not set and the **Stash base URL** is `https://stash.atlassian.com` and the SSH port is 7999, the SSH URL for the repository `Jira` in the project `Atlassian` will be `ssh://git@stash.atlassian.com:7999/ATLASSIAN/jira.git`

If you set up [port forwarding](#), you will need to set the **SSH base URL** to the machine and port that is being forwarded to Stash. However, you do not need to specify the port portion of the URL if the default SSH port (port

22) is being forwarded to Stash.

Client

Stash

| Port forwarding | SSH base URL | Stash base URL | SSH port | Resulting S |
|---|---|---|----------|------------------------|
| ✗ | Not set | https://stash.atlassian.com | 7999 | <code>ssh://git</code> |
| ✓ Port 22
-> 7999 | https://stash.atlassian.com | https://stash.atlassian.com | 7999 | <code>ssh://git</code> |

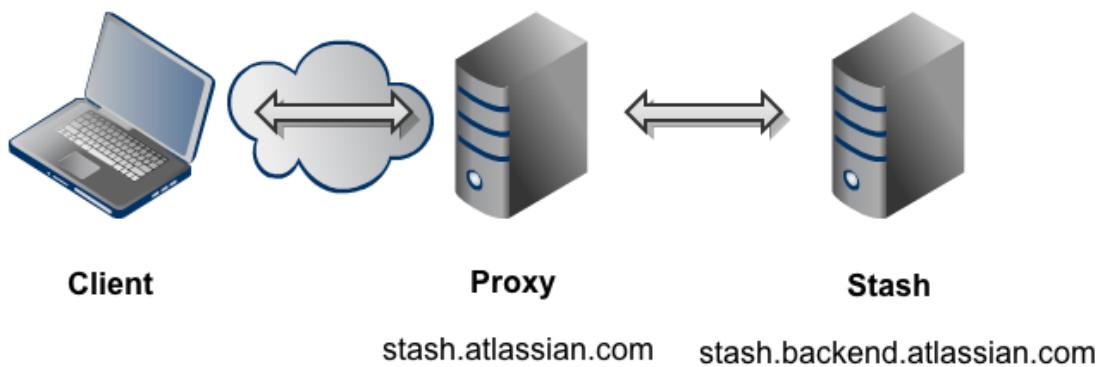

When running Stash behind a proxy

If you run Stash behind a http proxy such as Apache (e.g. as per our [instructions](#)), and if Apache runs on a different host, SSH will not be available on that host. Instead, you will need to set the SSH base URL to the machine Stash is actually running on (and the URL should include the SSH port Stash is serving from).

i For example, if the **SSH base URL** is set to `ssh://stash.backend.atlassian.com:7999`, the SSH URL for the repository Jira in the project Atlassian will be `ssh://git@stash.backend.atlassian.com:7999/ATLASSIAN/jira.git`

If you set up [port forwarding](#), you will need to set the **SSH base URL** to the proxy machine and port that is being forwarded to Stash. However, you do not need to specify the port portion of the URL if the default SSH port (port 22) is being forwarded to Stash.

i For example, if you set up port forwarding from your http proxy host, `stash.atlassian.com`, port 22, to `stash.backend.atlassian.com` port 7999, set the **SSH base URL** to `ssh://stash.atlassian.com`. Then, the SSH URL for the repository Jira in the project Atlassian will be `ssh://git@stash.atlassian.com/ATLASSIAN/jira.git`

| Port forwarding | SSH base URL | SSH port | Stash base URL |
|--|--|----------|--------------------------------|
| X | ssh://stash.backend.atlassian.com:7999 | 7999 | https://stash.backend.atlas... |
| ✓ Port
22 ->
7999 | ssh://stash.atlassian.com | 7999 | https://stash.backend.atlas... |
| ✓ Port
44 ->
7999 | ssh://stash.atlassian.com:44 | 7999 | https://stash.backend.atlas... |

Setting up SSH port forwarding

Why set up port forwarding?

There are two scenarios where you might want to set up port forwarding.

Remove port numbers from your SSH URLs

Stash listens for SSH connections on port 7999 by default.

Your users will need to include the port in the URL they use to clone from Stash, for example:

```
git clone ssh://git@stash.mycompany.com:7999/PROJECT/repo.git
```

Rather than have the port number in the URL, you may wish to set up port forwarding so that connections to the default SSH port are forwarded to the port Stash is listening on (e.g. you could forward port 22 to port 7999).

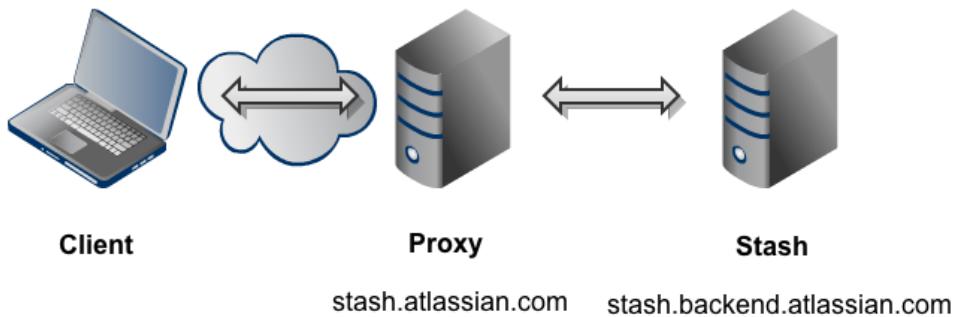

This would allow your users to use a URL without a port number in it, like this:

```
git clone ssh://git@stash.mycompany.com/PROJECT/repo.git
```

Stash is running behind a reverse proxy on a separate machine

You may be following our instructions for [setting up Stash behind an Apache front-end](#).

In this case, your users may not be able to access Stash directly for SSH connections, or if they can, you may wish to make the SSH and HTTPS URLs consistent.

For example, if you have the above topology, without port forwarding (and assuming the default port of 7999), your users will need to clone Stash directly from the backend, like this:

```
git clone ssh://git@stash.backend.atlassian.com:7999/PROJECT/repo.git
```

In your network, the `stash.backend.atlassian.com` machine may not be accessible directly, or you may want the URL to be consistent with the HTTPS URL of `https://stash.atlassian.com/scm/PROJECT/repo.git`.

In this case, you need to set up port forwarding on the `stash.atlassian.com` machine to accept connections and forward them to port 7999 on the `stash.backend.atlassian.com` machine.

How to set up port forwarding

HAProxy

Atlassian recommends the use of [HAProxy](#) for forwarding SSH connections through to Stash.

HAProxy is [supported](#) on Linux, Solaris and FreeBSD.

i HAProxy is not an Atlassian product, so Atlassian does not guarantee to provide support for its configuration. This section is provided for your information only – use it at your own risk. We recommend that you refer to the [HAProxy documentation](#).

Installing HAProxy

Your Operating System may support installing HAProxy via its system package manager, such as `apt-get`, `yum` or `rpm`. This will be the easiest way.

Alternatively, you may build HAProxy yourself and install it.

1. Download the latest version of HAProxy from <http://haproxy.1wt.eu/#down>.
2. Extract the archive and cd into the directory:

```
tar xzvf haproxy-1.4.21.tar.gz
cd haproxy-1.4.21
```

3. Read the instructions in the README for how to build on your system. This is generally quite simple - on a Linux 64 bit 2.6 Kernel, the command is:

```
make TARGET=linux26 ARCH=x86_64
```

4. If it completes successfully, install it following the instructions in the README:

```
sudo make install
```

Configuring HAProxy

HAProxy is extremely powerful - it is designed as a HTTPS load balancer, but also can serve as a port forwarder for ssh.

The full documentation for version 1.4 is [here](#). More documentation is available on the [HAProxy web site](#).

An example simple configuration is as follows:

```
global
    daemon
    maxconn 10000

defaults
    timeout connect 500s
    timeout client 5000s
    timeout server 1h

frontend sshd
    bind *:7999
    default_backend ssh
    timeout client 1h

backend ssh
    mode tcp
    server localhost-stash-ssh 127.0.0.1:7999 check port 7999
```

The above configuration will listen on port 7999 (indicated by the `bind` directive) on all network interfaces. As indicated by the `server` directive, traffic is forwarded to 127.0.0.1, port 7999. You will need to replace 127.0.0.1 with the IP address of the machine running Stash.

You can check your configuration by running:

```
haproxy -f haproxyconf.txt -c
```

To run haproxy, simply start it using

```
haproxy -f haproxyconf.txt
```

If you use HAProxy to additionally proxy HTTP traffic, ensure that the running mode configuration is set to http:

```
backend http
    mode http
    bind *:80
    server localhost-stash-http 127.0.0.1:7990
```

Using the default SSH port

You can configure HAProxy to listen on the default SSH port instead, so that the port does not need to be

specified in the clone URL.

By default, the normal ssh daemon is running on port 22. You have several options:

- Configure HAProxy to listen on an alternate port as in the previous example.
- Configure multiple network interfaces on the physical machine and force the default ssh daemon to listen on all but the interface for accessing Stash. Configure HAProxy to only listen on that interface.
- Move the default ssh daemon to listen on another port and let HAProxy bind on port 22.

We do not provide instructions on the last two options, except for how to configure HAProxy.

Use the same configuration as the last example, but change the bind port to 22, e.g.

```
...
frontend sshd
    bind *:22
...
```

You will have to run this configuration as the `root` user, using `sudo`, because it specifies a port to listen on that is less than 1024.

```
sudo haproxy -f haproxyconf.txt
```

Configuring the SSH base URL

Once port forwarding is set up, you will need to configure the SSH base URL in Stash so that the clone urls presented in Stash indicate the correct host and port to clone from. See the [SSH base URL](#) section in [Enabling SSH access to Git repositories in Stash](#).

Changing the port that Stash listens on

You may wish to change the port that Stash listens on from the default '7990' to a different value if another application is already running on that port.

To change the port, edit the `conf\server.xml` file in the <Stash installation directory>.

Find the following lines in `server.xml`:

```
<Server port="8006" shutdown="SHUTDOWN">
...
<Connector port="7990" protocol="HTTP/1.1"
    connectionTimeout="20000"
    useBodyEncodingForURI="true"
    redirectPort="8443"
    compression="on"

compressableMimeType="text/html, text/xml, text/plain, text/css, application/json"/>
```

You need to modify both the server port (default is 8006) and the connector port (default is 7990) to ports that are free on your machine. The server port is required by Tomcat but is not user-facing in any way. The connector port is the port you use to access Stash. For example, in the snippet above, the URL would be `http://example.com:7990`.

 Hint: You can use `netstat` to identify free ports on your machine. See more information on using `netstat` on [Windows](#) or on [Linux](#).

 If you are using a firewall, you should ensure that it is configured to allow http/https traffic over the connector port you have chosen.

 If you are running Stash on a Linux server and want to bind to privileged ports (those below 1024, for example port 80), you will **need to start Stash as root** in order to successfully bind to the port. Alternatively, you

can bind Stash to a port over 1024 and then configure iptables to redirect traffic from port 80 to the higher port.

Related pages:

- Specifying the base URL for Stash
- Proxying and securing Stash

Moving Stash to a different context path

There are various reasons why you may wish to change the context path for Stash. Two of those are:

- You are running Stash behind a proxy.
- You have another Atlassian application, or Java web application, available at the same hostname and context path as Stash, and are experiencing login problems (see [Login and session conflicts with multiple Atlassian applications](#)).

Related pages:

- [Integrating Stash with Apache HTTP Server](#)
- [Login and session conflicts with multiple Atlassian applications](#)

Upgrade Note

Since the manual steps of this process modify the Stash distribution, you will need to repeat Steps 1-6 each time you upgrade Stash. See the [Stash upgrade guide](#).

Changing the context path for Stash:

1. Navigate to the directory where you are running Stash from. This is *the install directory that you extracted the Stash distribution to*, not your Stash home directory.
2. Stop Stash. This can be done using `bin/stop-stash.bat` on Windows or `bin/stop-stash.sh` on OSX or Linux.
3. Edit `conf/server.xml` and find the element below:

```
<Context path="" docBase="\${catalina.home}/atlassian-stash" reloadable="false" useHttpOnly="true" />
```

Update the `path` attribute to reflect the context path that you want Stash to be accessible at, e.g. `/stash`:

```
<Context path="/stash" docBase="\${catalina.home}/atlassian-stash" reloadable="false" useHttpOnly="true" />
```

Then save the file.

4. Start Stash. This can be done using `bin/start-stash.bat` on Windows or `bin/start-stash.sh` on OSX or Linux.

Stash should now be available at the same host as before under the new context path. For example a server that was at <http://localhost:7990> will now be reachable at <http://localhost:7990/stash>.

5. Once Stash has started, go to the administration area and click **Server Settings** (under 'Settings'). Append the new context path to your base URL:

```
https://my-stash-hostname:7990/stash
```

6. Click **Save**.

⚠ Stash + Apache

Note that if you are running Stash behind Apache:

- You will need to make sure that the host or context path that Stash is exposed on is not also being used by another web application that is listening on a different port.
- If you have updated the Stash context path using the steps outlined above, you will need to update your Apache configuration, as described in [Integrating Stash with Apache HTTP Server](#).

⚠ Application Links

If you had Application Links set up before changing the context path in Stash, you will have to recreate those using the new Stash URL. See [Linking Stash with JIRA](#).

Running Stash with a dedicated user

For production installations, we recommend that you create a new dedicated user that will run Stash on your system. This user:

- Should be local.
- Should *not* have admin privileges.
- Should be a non-privileged user with read, write and execute access (called "Full control" permission on Windows) on the Stash install directory and [home directory](#).

Note that, on Windows, running Stash (whether as a service, or not) as a user that is part of the Administrator group can cause Windows to spend a lot of time running permission checks, with a consequent [performance impairment for Git operations](#).

See also [Running Stash as a Windows service](#) and [Running Stash as a Linux service](#).

For [Linux](#), here is an example of how to create a dedicated user to run Stash:

```
$ sudo /usr/sbin/useradd --create-home --home-dir /usr/local/Stash --shell  
/bin/bash Stash
```

Stash debug logging

On this page:

- Debug logging for the Stash server
 - Enabling debug logging via the UI
 - Enabling debug logging on startup
 - Enabling debug logging at runtime
- Profiling logging for the Stash server
 - Enabling profiling logging via the UI
- Debug logging for Git operations on the client
 - On Linux
 - On Windows
- Debug logging for the Stash Backup Client

Debug logging for the Stash server

This section describes how to enable debug level logging in Stash. Stash logs can be found in <STASH_HOME>/log.

When using the standard Stash distribution, logs for the Tomcat webserver that hosts Stash can be found in <Stash installation directory>/log.

Enabling debug logging via the UI

To enable debug logging, go to the Stash admin area, choose **Logging and Profiling** (under 'Support') and select **Enable debug logging**.

Enabling debug logging on startup

To enable debug logging whenever Stash is started, edit the `<STASH_HOME>/stash-config.properties` file (if this file doesn't exist then you should create it) and add the following two lines:

```
logging.logger.ROOT=DEBUG  
logging.logger.com.atlassian.stash=DEBUG
```

Enabling debug logging at runtime

To enable debug logging for the root logger once Stash has been started, run the following two commands in your terminal:

```
curl -u <ADMIN_USERNAME> -v -X PUT -d "" -H "Content-Type: application/json"  
<BASE_URL>/rest/api/latest/logs/rootLogger/debug  
curl -u <ADMIN_USERNAME> -v -X PUT -d "" -H "Content-Type: application/json"  
<BASE_URL>/rest/api/latest/logs/logger/com.atlassian.stash/debug  
  
# e.g.  
curl -u admin -v -X PUT -d "" -H "Content-Type: application/json"  
http://localhost:7990/rest/api/latest/logs/rootLogger/debug  
curl -u admin -v -X PUT -d "" -H "Content-Type: application/json"  
http://localhost:7990/rest/api/latest/logs/logger/com.atlassian.stash/debug
```

To enable debug logging for a specific logger, run the following command in your terminal:

```
curl -u <ADMIN_USERNAME> -v -X PUT -d "" -H "Content-Type: application/json"  
<BASE_URL>/rest/api/latest/logs/logger/<LOGGER_NAME>/debug  
  
# e.g.  
curl -u admin -v -X PUT -d "" -H "Content-Type: application/json"  
http://localhost:7990/rest/api/latest/logs/logger/com.atlassian.crowd/debug
```

Profiling logging for the Stash server

This section describes how to enable profiling in Stash. This log is essential when troubleshooting performance issues. Stash logs can be found in `<STASH_HOME>/log`.

When using the standard Stash distribution, logs for the Tomcat webserver that hosts Stash can be found in `<Stash installation directory>/log`.

Enabling profiling logging via the UI

To turn on detailed trace information, go to the Stash admin area, choose **Logging and Profiling** (under 'Support') and select **Enable profiling**.

Debug logging for Git operations on the client

Atlassian Support might request DEBUG logs for Git operations (on the client) when troubleshooting issues. You can enable DEBUG logging on the Git client by setting the following variables.

On Linux

Execute the following in the command line before executing the Git command:

```
export GIT_TRACE_PACKET=1  
export GIT_TRACE=1  
export GIT_CURL_VERBOSE=1
```

On Windows

Execute the following in the command line before executing the Git command:

```
set GIT_TRACE_PACKET=1  
set GIT_TRACE=1  
set GIT_CURL_VERBOSE=1
```

 Setting `GIT_CURL_VERBOSE` is only useful for connections over HTTP/S since SSH doesn't use the `libcurl` library.

Debug logging for the Stash Backup Client

Atlassian Support might request DEBUG logs for the Backup client when troubleshooting issues.

You can enable DEBUG logging on the Backup client by adding a file named `logback.xml` to your working directory (`pwd`) with the following content:

logback.xml

```
<included><logger name="com.atlassian.stash" level="DEBUG"/></included>
```

Data recovery and backups

This page provides an overview of the backup and restore strategies that Atlassian recommends for use with Stash:

- [Stash backup essentials](#)
- [Two ways to back up Stash](#)
- [How Stash backup and restore works](#)

Questions? Check out [FAQ - Data recovery and backup](#).

Related pages:

- [Connecting Stash to an external database](#)
- [Supported platforms](#)

Stash backup essentials

An effective backup strategy is essential:

- for avoiding data loss in the event of any system breakdown
- for restoring Stash after any system breakdown
- as part of the Stash upgrade process.

We **highly recommend** that you establish a data recovery plan that is aligned with your company's policies.

It is important to understand that there is a tight coupling between the Stash file system on disk and the database that Stash uses.

The following types of data are stored:

- The Stash home directory on the file system contains data about your repositories, as well as cache and log files (see [Stash home directory](#) for more detail).
- The Stash database contains data about pull requests (pointers to branches in the repos, comments and pull request diffs) and user management.

Any backup strategy that captures both the file system and database while Stash is still available to users runs the risk that the backed up Git repositories are corrupted or that the data in the database doesn't reflect the repository state on disk. Therefore, strategies for backing up and restoring Stash data must keep the repository data and the database perfectly synchronised.

With any strategy, you should schedule the backup window so as to minimise the impact on Stash availability. You might consider checking the access logs to determine patterns of lowest usage to help with this.

Two ways to back up Stash

When it comes to backing up, every organization has slightly different policies and requirements. Some organizations will want a backup solution that just works with minimal intervention, is independent of the underlying database and file system configuration, and don't mind a little downtime when the backup is run as part of a nightly maintenance schedule. Other organizations will have more specific policies and requirements surrounding the use of vendor-specific database and storage backup tools, the maximum acceptable downtime, the format of backups, and where the backups are ultimately stored.

To cater for these different policies and requirements, Stash provides two different backup strategies:

- the Stash Backup Client,
- Stash DIY Backup.

The features of each backup strategy are summarized in the following table:

| | Stash Backup Client | Stash DIY Backup |
|----------------------|---|--|
| Audience | Recommended for most people without specific backup policies and requirements. | Recommended for developers and system administrators who wish to minimize downtime and/or customize the Stash back up process for their specific database and file system configuration. |
| Usage | Ready to use out of the box. | Requires you to write some code (in your preferred language) to perform the backup steps. |
| Downtime | Locks Stash for the entire duration of the back up. | Only locks Stash for the minimum time necessary. |
| Backup | The backup is generic and does not depend on the underlying database configuration. | The backup relies on database-specific tools; for example, <code>pg_dump</code> is used if your back end database is PostgreSQL. |
| Destination | Saves the backup on the local filesystem. | Backups can be saved anywhere. |
| Documentation | Using the Stash Backup Client | Using Stash DIY Backup |

How Stash backup and restore works

Whether you use the Stash Backup Client or Stash DIY Backup, the backup process must ensure that you keep the repository data and the database perfectly synchronised, by:

- Shutting down Stash before performing the backup.
- Restoring the database and file system at the same time.
- Using the same version or snapshot of the database and file system.

Backing up Stash when using the internal database

When Stash uses the built-in HSQL database, the database files are stored in the Stash file system. See [Stash home directory](#) for more detail.

Making a backup of Stash involves copying the Stash home directory.

Note that Atlassian does not recommend using the internal database for a production instance.

Backing up Stash when using an external database

When Stash uses an external database, both the [Stash home directory](#) and the external database must be backed up.

If you use the Stash Backup Client, the external database is automatically included as part of the backup in a vendor-independent format.

If you use Stash DIY Backup, you have full control over the database backup tools and procedures, and can use your database vendor's specific backup tooling that is optimized for your database back end and stores the dump in a vendor-specific format.

Restoring Stash from a cold backup

Whether you use the Stash Backup Client or Stash DIY Backup, recovering a Stash instance from backup requires restoring both:

1. the file system backup, and
2. the database backup.

If you use the Stash Backup Client, these components are both automatically included when you run the Stash Restore Client.

If you use Stash DIY Backup, the backup script restores the file system backup, and you need to use your database vendor's specific restore tooling to restore the database backup.

Using the Stash Backup Client

Known issue

The Stash Backup Client 1.3.0+ requires Java 7+, but will not run on Oracle Java 7u65 or 8u9 due to this [regression bug](#).

This bug has been fixed in Java 8u20, and will be fixed in the next Java 7 release after u65. The `-noverify` argument can be used as a temporary workaround, as described in [STASH-5069](#).

This page describes using the Stash Backup Client, which is the backup strategy that Atlassian recommends for most people. This tool can be used to backup data from instances from Stash 2.7.0 and later.

For information about other backup strategies for Stash, see [Data recovery and backups](#). That page also discusses the tight coupling between the Stash file system on disk and the database that Stash uses.

With any strategy, you should consider scheduling the backup window so as to minimise the impact on Stash availability. You might consider checking the access logs to determine patterns of lowest usage to help with this.

We highly recommend that you establish a data recovery plan that is aligned with your company's policies.

Questions? Check out [FAQ - Data recovery and backup](#).

Download the Stash Backup Client from the [Atlassian Marketplace](#), or from here:

Download

Unzip the client into a directory on the Stash server.

On this page:

- Scheduling tasks on Windows
- Debug logging for the Stash Backup Client
- Stash - FAQ - Data recovery and backups

How it works

The Backup Client implements a common and universal way to back up a Stash instance, and does the following:

1. Locks access to the Stash application, the repositories managed by Stash and the Stash database for the entire duration of the back up. This state is called 'maintenance mode'.
2. Checks that all Git and database operations have completed.
3. Performs an application-specific backup of the [Stash home directory](#) and the Stash database. The backup is generic and does not depend on the server or database configuration.
4. Stores the backup as a single tar file on the local filesystem in the specified location.
5. Unlocks Stash from maintenance mode.

You will get an error message if you try to access the Stash web interface, or use the Stash hosting services, when Stash is in maintenance mode.

The client supports Windows and Linux platforms, and Stash versions 2.7 and higher, but does not provide ways to integrate with your organizations IT policies or processes.

As an indication of the unavailability time that can be expected when using the Stash Backup Client, in our testing and internal use we have seen downtimes for Stash of 7–8 minutes with repositories totalling 6 GB in size. For comparison, using [Stash DIY Backup](#) for the same repositories typically results in a downtime of less than a minute.

What is backed up

The Backup Client backs up all the following data:

- the database Stash is connected to (either the internal or external DB)
- managed Git repositories
- the Stash audit logs
- installed plugins and their data

The backup does NOT include the following files and directories:

- `export/*`
- `log/*` (except for the audit logs)
- `data/db*` (HSQL data in the DB is backed up, but the files on disk are not)
- `tmp`
- the `plugins` directory (except for the `installed-plugins` directory)

Note that the `caches` directory is included in the backup because it contains previously indexed heads.

Backing up Stash using the client

The Backup Client must be run from somewhere with access to the Stash home directory. Usually, you will run the Backup Client directly on the Stash server. Run the client with the following command:

```
java -jar <path/to/stash-backup-client.jar>
```

Configuration options are kept in the `backup-config.properties` file that is included with the client – this file is automatically read when the client is run. The properties are fully documented in the `backup-config.properties` file, but include:

| | |
|-----------------------------|---|
| <code>stash.home</code> | Defines the location of the home directory of the Stash instance you wish to back up or restore to. REQUIRED

If omitted here it will be taken from the <code>STASH_HOME</code> environment variable or the Java system property of the same name if supplied to the Backup and Restore Client on the command line. As a required value, backup and restore will fail if it is not supplied through one of these mechanisms. |
| <code>stash.user</code> | Defines the username of the Stash user with administrative privileges you wish to perform the backup. REQUIRED

If omitted here it will be taken from the Java system property of the same name if supplied to the Backup Client on the command line. As a required value, backup will fail if it is not supplied through one of these mechanisms. |
| <code>stash.password</code> | Defines the password of the Stash user with administrative privileges you wish to perform the backup. REQUIRED

If omitted here it will be taken from the Java system property of the same name if supplied to the Backup Client on the command line. As a required value, backup will fail if it is not supplied through one of these mechanisms. |
| <code>stash.baseUrl</code> | Defines base URL of the Stash instance you wish to back up. REQUIRED

E.g. <code>http://localhost:7990/stash</code> or <code>http://stashserver/</code> .

If omitted here it will be taken from the Java system property of the same name if supplied on the command line to the Backup Client. As a required value, backup will fail if it is not supplied through one of these mechanisms. |
| <code>backup.home</code> | Defines where the Backup Client will store its own files, such as backup archives.

If not specified, these files are stored beneath the working directory for the Backup Client. Backup files will be stored in a <code>backup</code> subdirectory and logs will be stored in a <code>logs</code> subdirectory.

Note that on Windows, you must use two backslashes between paths. E.g. <code>C:\\path\\to\\folder</code> or instead use the forward slash e.g. <code>C:/path/to/folder</code> .

The Stash <code>backup.home</code> directory cannot be located in the <code>stash.home</code> directory. If that is the case, the backup client will fail. |

Alternatively, these properties can be given on the command-line, when they need to be prefixed with "`-D`", and be placed before the "`-jar`" parameter. For example:

```
java -Dstash.password="admin" -Dstash.user="admin"
-Dstash.baseUrl="http://localhost:7990" -Dstash.home=path/to/stash/home
-Dbackup.home=path/to/backup-home -jar stash-backup-client.jar
```

Cancelling the client backup

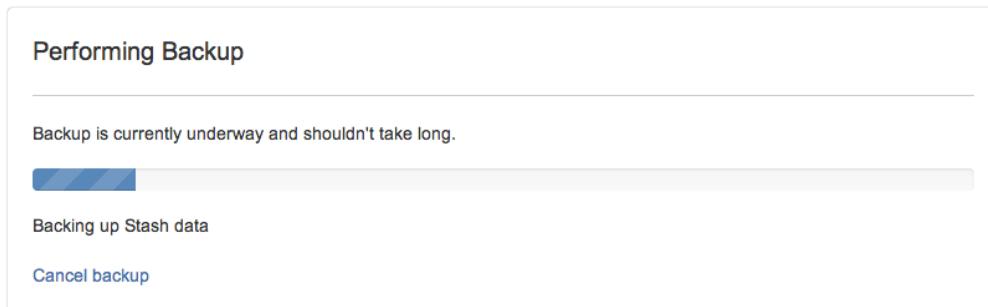

You can cancel the running client backup operation if necessary.

To cancel the backup:

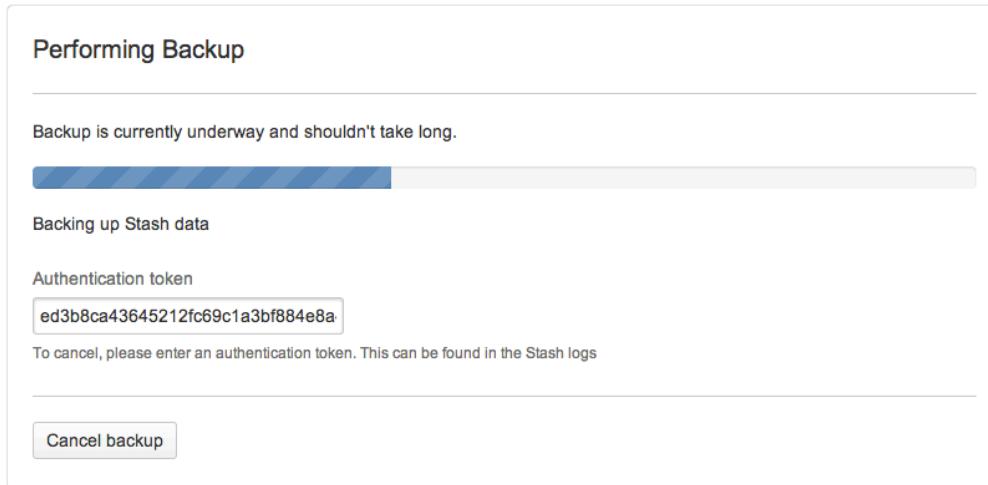

1. Copy the cancel token echoed by the client in the terminal (or the Command Prompt on Windows):

```
Contacting Stash
Using Stash 2.7.0
Stash has been locked for maintenance. It may be unlocked with token: 3e1e4991cb6bbd900f2d6a86197ffac508fc0c05
(3%) Starting database backup on Stash. It may be cancelled with token: ed3b8ca43645212fc69c1a3bf884e8a425477d24
(3%) Waiting for SCM operations to finish
(11%) Verifying Stash home
(15%) Verifying Stash home
(15%) Verifying Stash home
(23%) Backing up Stash home
```

2. Go to the Stash interface in your browser. Stash will display this screen:

3. Click **Cancel backup**, and enter the cancel token:

4. Click **Cancel backup**.

Restoring Stash to use the existing DB

This section applies if you intend to perform a restore into the existing DB configuration/technology. Therefore, in this scenario it is assumed the restore is performed on the same server as that on which Stash was originally backed up.

The Restore Client will use the JDBC connection configuration contained in the backup you are restoring from.

When restoring Stash, the Restore Client must be run on the machine that Stash should be restored to. To ensure accidental restores do not delete existing data, the Restore Client will only restore into an empty home directory and an empty database. So, make sure that these prerequisites are met:

- Stop your Stash instance.
- Delete the content of the current home directory, so that it is empty.
- Drop the existing tables in your database so it is empty. The database still needs to exist with the same user/password, and it should have the configuration described in the 'Create the Stash database' section of the relevant page here:
 - MySQL

- Oracle
- PostgreSQL
- SQL Server
- Run the Restore Client using the following command (replacing 'path/to/stash/home' and '/path/to/original/backup/file' with your own values):

```
java -Dstash.home="path/to/stash/home" -jar stash-restore-client.jar
/path/to/original/backup/file
```

- Follow Steps 3 to 5 of the [Stash upgrade guide](#). Note that you should use the same version of Stash that was used to back up Stash.

Restoring Stash to use a newly created DB

This section applies if you intend to perform a restore into a newly created DB. This scenario assumes the restore is done to a server different from the one from which Stash was originally backed up.

The restore process is database agnostic, meaning the database you are restoring your backup to could be of a different configuration or type from the originally backed up database.

When restoring Stash, the Restore Client must be run on the machine that Stash should be restored to. To ensure accidental restores do not delete existing data, the Restore Client will only restore into an empty home directory and an empty database. So, make sure that these prerequisites are met:

- Create a new empty home directory using the user account that will be used to run Stash.
- Create the database. It should have the configuration described in the 'Create the Stash database' section of the relevant page here:
 - MySQL
 - Oracle
 - PostgreSQL
 - SQL Server
- Run the Restore Client. See the following section.
- Follow Steps 3 to 5 of the [Stash upgrade guide](#). Note that you should use the same version of Stash that was used to back up Stash. For MySQL, you also need to [download and install the JDBC driver](#).

Running the Restore Client from the command line

You can run the Restore Client from the command line. In this scenario, as you will have created a new database, you need to specify the JDBC connection parameters that should be used.

The Restore Client uses the JDBC connection configuration specified in the `jdbc.driver`, `jdbc.url`, `jdbc.user` and `jdbc.password` parameters used in the command to run the Restore Client (see below).

Once the database backup is successfully restored, the client will write the specified parameters to the `stash-config.properties` file in the newly restored Stash home directory, allowing the new instance to connect to the restored database once the steps outlined below are followed.

In this example, you can follow the restore into a newly created PostgreSQL database:

```
java -Djdbc.override=true -Djdbc.driver=org.postgresql.Driver
-Djdbc.url=jdbc:postgresql://HOSTNAME:PORT/DATABASE -Djdbc.user=stashuser
-Djdbc.password=password -Dstash.home="path/to/stash/home" -jar
/path/to/stash-restore-client.jar /path/to/original/backup/file
```

Alternatively, you can configure these parameters on the `backup-config.properties` file – make sure the file exists in the current working directory. A sample file is shipped with the client. The properties are fully documented in the `backup-config.properties` file and more details are described below:

| | |
|---------------|--|
| stash.home | The full path to a directory that the Restore Client will populate with the Stash home data. This directory must be empty.
On Windows, you must use two backslashes (\\) or a single forward slash (/) to separate paths. |
| jdbc.override | By default, the Restore Client will restore into the same database that was backed up. If jdbc.override is set to true, the Restore Client will restore into the database specified by the jdbc properties in the table below. The database must be empty. |
| jdbc.driver | The driver class that Stash should use to log in to the new database. See examples below. |
| jdbc.url | The connection details for the new database, formatted as a JDBC URL. See examples below. |
| jdbc.user | The username that Stash should use to log in to the new database. |
| jdbc.password | The password that Stash should use to log in to the new database. |

Example use of JDBC properties

Example jdbc.driver and jdbc.url properties are shown below:

| Database | jdbc.driver | jdbc.url |
|------------|--|---|
| MySQL | com.mysql.jdbc.Driver | jdbc:mysql://HOSTNAME:PORT/DATABASE?autoReconnect=true&useSSL=false |
| Oracle | oracle.jdbc.driver.OracleDriver | jdbc:oracle:thin:@//HOSTNAME:PORT/SERVICE_NAME |
| PostgreSQL | org.postgresql.Driver | jdbc:postgresql://HOSTNAME:PORT/DATABASE |
| SQL Server | com.microsoft.sqlserver.jdbc.SQLServerDriver | jdbc:sqlserver://HOSTNAME:PORT;databaseName=DATABASE_NAME;integratedSecurity=true |

DRAFT - Using the Stash Backup Client

Known issue

The Stash Backup Client 1.3.0+ requires Java 7+, but will not run on Oracle Java 7u65 or 8u9 due to this [regression bug](#).

This bug has been fixed in Java 8u20, and will be fixed in the next Java 7 release after u65. The `-noverify` argument can be used as a temporary workaround, as described in [STASH-5069](#).

This page describes using the Stash Backup Client, which is the backup strategy that Atlassian recommends for most people. This tool can be used to backup data from instances from Stash 2.7.0 and later.

For information about other backup strategies for Stash, see [Data recovery and backups](#). That page also discusses the tight coupling between the Stash file system on disk and the database that Stash uses.

With any strategy, you should consider scheduling the backup window so as to minimise the impact on Stash availability. You might consider checking the access logs to determine patterns of lowest usage to help with this.

We highly recommend that you establish a data recovery plan that is aligned with your company's policies.

How it works

The Backup Client implements a common and universal way to back up a Stash instance, and does the following:

1. Locks access to the Stash application, the repositories managed by Stash and the Stash database for the entire duration of the back up. This state is called 'maintenance mode'.
2. Checks that all Git and database operations have completed.
3. Performs an application-specific backup of the [Stash home directory](#) and the Stash database. The backup is generic and does not depend on the server or database configuration.
4. Stores the backup as a single tar file on the local filesystem in the specified location.
5. Unlocks Stash from maintenance mode.

You will get an error message if you try to access the Stash web interface, or use the Stash hosting services, when Stash is in maintenance mode.

The client supports Windows and Linux platforms, and Stash versions 2.7 and higher, but does not provide ways to integrate with your organization's IT policies or processes.

As an indication of the unavailability time that can be expected when using the Stash Backup Client, in our testing and internal use we have seen downtimes for Stash of 7–8 minutes with repositories totalling 6 GB in size. For comparison, using [Stash DIY Backup](#) for the same repositories typically results in a downtime of less than a minute.

What is backed up

The Backup Client backs up all the following data:

- the database Stash is connected to (either the internal or external DB)
- managed Git repositories
- the Stash audit logs
- installed plugins and their data

The backup does NOT include the following files and directories:

- `export/*`
- `log/*` (except for the audit logs)
- `data/db*` (HSQL data in the DB is backed up, but the files on disk are not)
- `tmp`
- the `plugins` directory (except for the `installed-plugins` directory)

Note that the `caches` directory is included in the backup because it contains previously indexed heads.

Backing up Stash using the client

The Backup Client must be run from somewhere with access to the Stash home directory. Usually, you will run the Backup Client directly on the Stash server. Run the client with the following command:

```
java -jar <path/to/stash-backup-client.jar>
```

Configuration options are kept in the `backup-config.properties` file that is included with the client – this file is automatically read when the client is run. The properties are fully documented in the `backup-config.properties` file, but include:

| | |
|-----------------------------|---|
| <code>stash.home</code> | Defines the location of the home directory of the Stash instance you wish to back up or restore to. REQUIRED

If omitted here it will be taken from the <code>STASH_HOME</code> environment variable or the Java system property of the same name if supplied to the Backup and Restore Client on the command line. As a required value, backup and restore will fail if it is not supplied through one of these mechanisms. |
| <code>stash.user</code> | Defines the username of the Stash user with administrative privileges you wish to perform the backup. REQUIRED

If omitted here it will be taken from the Java system property of the same name if supplied to the Backup Client on the command line. As a required value, backup will fail if it is not supplied through one of these mechanisms. |
| <code>stash.password</code> | Defines the password of the Stash user with administrative privileges you wish to perform the backup. REQUIRED

If omitted here it will be taken from the Java system property of the same name if supplied to the Backup Client on the command line. As a required value, backup will fail if it is not supplied through one of these mechanisms. |
| <code>stash.baseUrl</code> | Defines base URL of the Stash instance you wish to back up. REQUIRED

E.g. <code>http://localhost:7990/stash</code> or <code>http://stashserver/</code> .

If omitted here it will be taken from the Java system property of the same name if supplied on the command line to the Backup Client. As a required value, backup will fail if it is not supplied through one of these mechanisms. |
| <code>backup.home</code> | Defines where the Backup Client will store its own files, such as backup archives.

If not specified, these files are stored beneath the working directory for the Backup Client. Backup files will be stored in a <code>backup</code> subdirectory and logs will be stored in a <code>logs</code> subdirectory.

Note that on Windows, you must use two backslashes between paths. E.g. <code>C:\\path\\to\\folder</code> or instead use the forward slash e.g. <code>C:/path/to/folder</code> .

The Stash <code>backup.home</code> directory cannot be located in the <code>stash.home</code> directory. If that is the case, the backup client will fail. |

Alternatively, these properties can be given on the command-line, when they need to be prefixed with "`-D`", and be placed before the "`-jar`" parameter. For example:

```
java -Dstash.password="admin" -Dstash.user="admin"
-Dstash.baseUrl="http://localhost:7990" -Dstash.home=path/to/stash/home
-Dbackup.home=path/to/backup-home -jar stash-backup-client.jar
```

Cancelling the client backup

You can cancel the running client backup operation if necessary.

To cancel the backup:

1. Copy the cancel token echoed by the client in the terminal (or the Command Prompt on Windows):

```
Contacting Stash
Using Stash 2.7.0
Stash has been locked for maintenance. It may be unlocked with token: 3e1e4991cb6bbd900f2d6a86197ffac508fc0c05
(3%) Starting database backup on Stash. It may be cancelled with token: ed3b8ca43645212fc69c1a3bf884e8a425477d24
(3%) Waiting for SCM operations to finish
(11%) Verifying Stash home
(15%) Verifying Stash home
(15%) Verifying Stash home
(23%) Backing up Stash home
```

2. Go to the Stash interface in your browser. Stash will display this screen:

The screenshot shows a "Performing Backup" page. It displays a message: "Backup is currently underway and shouldn't take long." Below this is a progress bar with a blue segment on the left. Underneath the progress bar, the text "Backing up Stash data" is visible. At the bottom of the page is a blue "Cancel backup" button.

3. Click **Cancel backup**, and enter the cancel token:

The screenshot shows a "Performing Backup" page. It displays a message: "Backup is currently underway and shouldn't take long." Below this is a progress bar with a blue segment on the left. Underneath the progress bar, the text "Backing up Stash data" is visible. A new section labeled "Authentication token" contains a text input field containing the token "ed3b8ca43645212fc69c1a3bf884e8a". Below the input field is a note: "To cancel, please enter an authentication token. This can be found in the Stash logs". At the bottom of the page is a blue "Cancel backup" button.

4. Click **Cancel backup**.

Restoring Stash

Basically you could decide to restore Stash into the same database as it was hooked to before the backup or into a new database which could even be from a technology different to the previous one (i.e. migrating from MS SQL to Oracle during the restore). Within same contexts, you could use the restore to have Stash run either on a new or the old server. These two processes will be detailed in the next two sections.

Restoring Stash into the backed-up DB instance

You can restore Stash to either the original server that Stash ran on or to a new one. This procedure will allow you to restore your backup into a `STASH_HOME` as specified on its command line whilst keeping the same JDBC credentials as you had in the previous instance

Note that, to ensure accidental restores do not delete existing data, the Restore Client will only restore into an empty `STASH_HOME` and an empty database.

Restoring Stash to the original server

1. Stop your Stash instance if it is running.
2. Delete the contents of the current STASH_HOME directory. As observed above, the Restore Client will only work for an empty STASH_HOME.
3. Drop the existing tables in your database. As observed above, the Restore Client will only work for an empty database.
4. Run the Restore Client using the following command (replacing 'path/to/stash/home' by the one defined on step #2 and '/path/to/original/backup/file' with your own value):

```
java -Dstash.home="path/to/stash/home" -jar stash-restore-client.jar
/path/to/original/backup/file
```

- The Restore Client will use the JDBC connection parameters contained in the backup file you are restoring from – the file contains the parameter values that Stash used prior to being backed up – which is what you want when restoring Stash to use the same DB instance that Stash used before backing up,
5. Follow Steps 3 to 5 of the [Stash upgrade guide](#). Note that you should download and use the same release of Stash that was used to back it up. If you use a version above, notice that an upgrade will be performed as well.

Restoring Stash to a new server

1. Make sure that the new server has network access to the server which runs the database instance previously used by Stash.
2. Create a new empty directory which will be used as STASH_HOME.
3. Run the Restore Client using the following command (replacing 'path/to/stash/home' by the one defined on step #2 and '/path/to/original/backup/file' with your own value):

```
java -Dstash.home="path/to/stash/home" -jar stash-restore-client.jar
/path/to/original/backup/file
```

- The Restore Client will use the JDBC connection parameters contained in the backup file you are restoring from – the file contains the parameter values that Stash used prior to being backed up – which is what you want when restoring Stash to use the same DB instance that Stash used before backing up,
4. Follow Steps 3 to 5 of the [Stash upgrade guide](#). Note that you should download and use the same release of Stash or above the one that was used to back it up. If you use a version above, notice that an upgrade will be performed as well.

Restoring Stash into a newly created DB instance

You can restore Stash to either the original machine that Stash ran on or to a different machine. However, the Restore Client must be run on a machine that has access to the Stash home directory. Usually, you will run the Restore Client directly on the Stash server.

It is important to realise that when you run the Restore Client to restore Stash to use a newly created DB, you will need to provide the JDBC connection parameters that Stash should use to connect to the new DB.

Note that, to ensure accidental restores do not delete existing data, the Restore Client will only restore into an empty home directory and an empty database. The restore process is database agnostic, meaning the database you are restoring your backup to could be of a different configuration or type from the originally backed up database.

To restore Stash to a newly created DB:

1. Create a new empty home directory using the user account that will be used to run Stash.
2. Create the database. It should have the configuration described in the 'Create the Stash database' section of the relevant page here:
 - MySQL
 - Oracle
 - PostgreSQL
 - SQL Server
3. Run the Restore Client, specifying the JDBC connection parameters either on the command line, or in the

`backup-config.properties` file, as described below. Once the database backup is successfully restored, the client writes the specified parameters to the `stash-config.properties` file in the newly restored Stash home directory, allowing the new instance to connect to the restored database.

- Follow Steps 3 to 5 of the [Stash upgrade guide](#). Note that you should use the same version of Stash that was used to back up Stash. For MySQL, you also need to [download and install the JDBC driver](#).

Specifying JDBC parameters when running the Restore Client

When you run the Restore Client to restore Stash to use a newly created DB, you need to provide the JDBC connection parameters that Stash should use to connect to the new DB. You can specify the JDBC connection parameters either on the command line, or in the `backup-config.properties` file, as described here:

Specifying the JDBC connection parameters on the command line

When you specify the JDBC connection parameters on the command-line, they need to be prefixed with "`-D`", and be placed before the "`-jar`" parameter. For example:

```
java -Djdbc.override=true -Djdbc.driver=org.postgresql.Driver
-Djdbc.url=jdbc:postgresql://HOSTNAME:PORT/DATABASE -Djdbc.user=stashuser
-Djdbc.password=password -Dstash.home="path/to/stash/home" -jar
/path/to/stash-restore-client.jar /path/to/original/backup/file
```

Specifying the JDBC connection parameters in the properties file

Alternatively, you can configure the JDBC parameters in the `backup-config.properties` file that is included with the client. This file is automatically read when the client is run. Make sure the file exists in the current working directory. The parameters are fully documented in the `backup-config.properties` sample file that is shipped with the client and include:

| | |
|----------------------------|--|
| <code>stash.home</code> | The full path to a directory that the Restore Client will populate with the Stash home data. This directory must be empty.
On Windows, you must use two backslashes (<code>\\"</code>) or a single forward slash (<code>/</code>) to separate paths. |
| <code>jdbc.override</code> | By default, the Restore Client will restore into the same database that was backed up. If <code>jdbc.override</code> is set to <code>true</code> , the Restore Client will restore into the database specified by the <code>jdbc</code> properties in the table below. The database must be empty. |
| <code>jdbc.driver</code> | The driver class that Stash should use to log in to the new database. See examples below. |
| <code>jdbc.url</code> | The connection details for the new database, formatted as a JDBC URL. See examples below. |
| <code>jdbc.user</code> | The username that Stash should use to log in to the new database. |
| <code>jdbc.password</code> | The password that Stash should use to log in to the new database. |

Example use of JDBC properties

Example `jdbc.driver` and `jdbc.url` properties are shown below:

| Database | <code>jdbc.driver</code> | <code>jdbc.url</code> |
|------------|--|--|
| MySQL | <code>com.mysql.jdbc.Driver</code> | <code>jdbc:mysql://HOSTNAME:PORT/DATABASE?autoReconnect=true&useSSL=false</code> |
| Oracle | <code>oracle.jdbc.driver.OracleDriver</code> | <code>jdbc:oracle:thin:@//HOSTNAME:PORT/SERVICE_NAME</code> |
| PostgreSQL | <code>org.postgresql.Driver</code> | <code>jdbc:postgresql://HOSTNAME:PORT/DATABASE</code> |

| | | |
|------------|--|--|
| SQL Server | com.microsoft.sqlserver.jdbc.SQLServerDriver | jdbc:sqlserver://HOSTNAME:PORT;databaseName= |
|------------|--|--|

Using Stash DIY Backup

Stash DIY Backup was introduced in Stash 2.12 as an alternative strategy to using the [Stash Backup Client](#). It allows you to:

- significantly reduce the downtime needed to create a consistent backup,
- use the vendor-specific database backup tool appropriate to your back end database, for example:
 - pg_dump if your back end database is PostgreSQL, or
 - sqlcmd with an appropriate command for differential backup, if your back end database is Microsoft SQL Server,
- use the optimal file system backup tool for your Stash home directory, for example:
 - an LVM snapshot logical volume if your Stash home directory uses LVM,
 - a SAN-based backup if your Stash home directory uses a Storage Area Network, or
 - rsync, if available.

The use of optimal, vendor-specific database and file system backup tools is the key to reducing Stash downtime to a minimum.

Stash DIY Backup does require you to write some code in a language of your choice to perform the required backup steps, using the REST API available for Stash 2.12.

DIY Backup supports Windows and Linux platforms, and Stash versions 2.12 and higher.

For information about other backup strategies for Stash, see [Data recovery and backups](#). That page also discusses the tight coupling between the Stash file system on disk and the database that Stash uses.

i Please note that the examples on this page are provided as guidance for developing a DIY Backup solution. As such, the third-party tools described are for example only – you will need to choose the tools that are appropriate to your own specific installation of Stash.

Consult the vendor documentation for the third-party tools you choose – unfortunately, Atlassian can not provide support for those tools.

Download the worked example scripts from Bitbucket:

[Download](#)

This page:

- Describes a complete DIY Backup solution for a PostgreSQL database and local filesystem, using bash scripts.

↳ shell scripts.

- Provides background information about how the Stash REST API can be used for DIY Backups.

You can use this solution directly if your Stash instance has the same or similar configuration, or use this as a starting point to develop your own DIY Backup solution tailored to your hardware configuration.

How it works

When you use DIY Backup instead of the Stash Backup Client, you have complete control over the backup steps, and can implement any custom processes you like in the language of your choice. For example, you can use your database's incremental or fast snapshot tools and/or your file server's specific tools as part of a DIY Backup.

The DIY Backup works in a similar way to the [Stash Backup Client](#) and does the following:

1. Prepare the instance for backup. This happens before Stash is locked, so we want to do as much processing as possible here in order to minimize downtime later. For example, we can take an initial snapshot using incremental database and filesystem utilities. These do not have to be 100% consistent as Stash is still running and modifying the database and filesystem. But taking the initial snapshot now may reduce the amount of work done later (while Stash is locked), especially if the amount of data modified between backups is large. The steps include:
 - Taking an initial backup of the database (if it supports progressive/differential backups).
 - Doing an initial `rsync` of the home folder to the backup folder.
2. Tell Stash to initiate the backup. Stash will:
 - Lock the instance.
 - Drain and latch the connections to the database and the filesystem.
 - Wait for the drain/latch step to complete.
3. Once the Stash instance is ready for backup we can start with the actual DIY Backup. This will include steps to:
 - Make a fully consistent backup of the database, using `pg_dump`.
 - Make a fully consistent backup of the filesystem, using `rsync`.
4. Notify the Stash instance once the backup process finishes and unlock it.
5. Archive all files created during the backup into one big archive.

A user will get an error message if they try to access the Stash web interface, or use the Stash hosting services, when Stash is in maintenance mode.

As an indication of the unavailability time that can be expected, in our testing and internal use we have seen downtimes for Stash of 7–8 minutes with repositories totalling 6 GB in size when using the Stash Backup Client. For comparison, using [Stash DIY Backup](#) for the same repositories typically results in a downtime of less than a minute.

What is backed up

DIY Backup backs up all the same data as the Stash Backup Client:

- the database Stash is connected to (either the internal or external DB)
- managed Git repositories
- the Stash logs
- installed plugins and their data

DIY Backups using Bash scripts

This section presents a complete DIY Backup solution that uses the following tools:

- `bash` - for scripting
- `jq` - an open source command line JSON processor for parsing the REST responses from Stash
- `pg_dump` (or `sqlcmd`) - for backing up a PostgreSQL database
- `rsync` - for backing up the filesystem
- `tar` - for making a backup archive

This approach (with small modifications) can be used for running DIY Backups on:

- Linux and Unix
- OSX
- Windows with cygwin (note that cygwin Git is *not* supported by Stash).

Download the scripts from [Bitbucket](#).

The scripts below are for example only and are **not** kept in sync with the scripts found in the Bitbucket repository.

Bash scripts

These scripts implement one particular solution for performing a DIY Backup:

`stash.diy-backup.sh`

```
#!/bin/bash

#####
# Configure the settings in this section to suit your Stash installation.

SCRIPT_DIR=$(dirname $0)
# Contains all variables used by the other scripts.
source ${SCRIPT_DIR}/stash.diy-backup.vars.sh
# Contains util functions (bail, info, print).
source ${SCRIPT_DIR}/stash.diy-backup.utils.sh
# Contains functions that perform lock/unlock and backup of a Stash instance.
source ${SCRIPT_DIR}/stash.diy-backup.common.sh

# The following scripts contain functions which are dependant on the
# configuration of this Stash instance.
# Generally every each of them exports certain functions, which can be
# implemented in different ways.

# Exports the following functions:
#     stash_prepare_db      - for making a backup of the DB if differential
# backups a possible. Can be empty.
#     stash_backup_db        - for making a backup of the Stash DB.
source ${SCRIPT_DIR}/stash.diy-backup.postgresql.sh

# Exports the following functions:
#     stash_prepare_home    - for preparing the filesystem for the backup.
#     stash_backup_home      - for making the actual filesystem backup.
source ${SCRIPT_DIR}/stash.diy-backup.rsync.sh

# Exports the following functions:
#     stash_backup_archive - for archiving the backup folder and putting the
# archive in archive folder.
source ${SCRIPT_DIR}/stash.diy-backup.tar.sh

#####
# This section does NOT need any configuration.
# The actual back up process. It has the following steps:

# Prepare the database and the filesystem for taking a backup.
stash_prepare_db
stash_prepare_home

# Locking the Stash instance, starting an external backup and waiting for
instance readiness.
stash_lock
stash_backup_start
stash_backup_wait

# Backing up the database and reporting 50% progress.
stash_backup_db
stash_backup_progress 50

# Backing up the filesystem and reporting 100% progress.
stash_backup_home
stash_backup_progress 100

# Unlocking the Stash instance.
stash_unlock

# Making an archive for this backup.
stash_backup_archive
#####
```

The `stash.diy-backup.sh` script above references the following scripts:

▼ [stash.diy-backup.vars.sh](#)

```
stash.diy-backup.vars.sh
#!/bin/bash

# Used by the scripts for verbose logging. If not true only errors will be
# shown.
STASH_VERBOSE_BACKUP=TRUE

# The base url used to access this Stash instance.
STASH_URL=

# The username and password for the user used to make backups (and have this
# permission).
STASH_BACKUP_USER=
STASH_BACKUP_PASS=

# The name of the database used by this instance.
STASH_DB=stash

# The path to Stash home folder (with trailing /).
STASH_HOME=

# The path to working folder for the backup.
STASH_BACKUP_ROOT=
STASH_BACKUP_DB=${STASH_BACKUP_ROOT}/stash-db/
STASH_BACKUP_HOME=${STASH_BACKUP_ROOT}/stash-home/

# The path to where the backup archives are stored.
STASH_BACKUP_ARCHIVE_ROOT=
```

▼ [stash.diy-backup.utils.sh](#)

stash.diy-backup.utils.sh

```
#!/bin/bash

function error {
    echo "[${STASH_URL}] ERROR:" $*
}

function bail {
    error $*
    exit 99
}

function info {
    if [ "${STASH_VERBOSE_BACKUP}" == "TRUE" ]; then

#####
```

Running the Bash script

Once you have downloaded the Bash scripts, you need to customize two files:

- `stash.diy-backup.vars.sh`
- `stash.diy-backup.sh`

for your setup.

For example, if your Stash server is called `stash.example.com`, uses port 7990, and has its home directory in `/stash-home`, here's how you might configure `stash.diy-backup.vars.sh`:

Example usage:

```
#!/bin/bash  
  
# Used by the scripts for verbose logging. If not true only errors  
# will be shown.  
STASH_VERBOSE_BACKUP=TRUE  
  
# The base url used to access this Stash instance.  
STASH_URL= http://stash.example.com:7990  
  
# The username and password for the account used to make backups  
(and has permission for this).  
STASH_BACKUP_USER= admin  
STASH_BACKUP_PASS= admin  
  
# The name of the database used by this instance.  
STASH_DB= stash  
  
# The path to Stash home folder (with trailing /).  
STASH_HOME= /stash-home  
  
# The path to the working folder for the backup.  
STASH_BACKUP_ROOT= /stash-backup  
STASH_BACKUP_DB=${STASH_BACKUP_ROOT}/stash-db/  
STASH_BACKUP_HOME=${STASH_BACKUP_ROOT}/stash-home/  
  
# The path to where the backup archives are stored.  
STASH_BACKUP_ARCHIVE_ROOT= /stash-backup-archives
```

The supplied `stash.diy-backup.vars.sh` is written to use PostgreSQL, rsync, and tar by default. But if you want to use different tools, you can also customize the top section of this file to use different tools as follows:

Example usage:

```
# The following scripts contain functions which are dependant on the
configuration of this Stash instance.

# Generally, each of them exports certain functions, which can be
implemented in different ways.

# Exports the following functions:
# stash_prepare_db - for making a backup of the DB if differential
backups are possible. Can be empty.
# stash_backup_db - for making a backup of the Stash DB.

source ${SCRIPT_DIR}/ stash.diy-backup.postgresql.sh

# Exports the following functions: # stash_prepare_home - for
preparing the filesystem for the backup. # stash_backup_home - for
making the actual filesystem backup.

source ${SCRIPT_DIR}/ stash.diy-backup.rsync.sh

# Exports the following functions:
# stash_backup_archive - for archiving the backup folder and moving
the archive to the archive folder.

source ${SCRIPT_DIR}/ stash.diy-backup.tar.sh
```

You also need to create two directories for DIY Backup to work:

1. \${STASH_BACKUP_ROOT} is a working directory (/stash-backup in our example) where copies of Stash's home directory and database dump are built during the DIY Backup process.
2. \${STASH_BACKUP_ARCHIVE_ROOT} is the directory (/stash-backup-archives in our example) where the final backup archives are saved.

Once your `stash.diy-backup.vars.sh` is correctly configured, run the backup in a terminal window:

```
$ ./stash.diy-backup.sh
```

The first time you run the backup, `rsync` will do most of the work since the `/stash-backup` working directory is initially empty. This is normal. Fortunately, this script performs one `rsync` before locking Stash, followed by a second `rsync` while Stash is locked. This minimizes downtime.

On second and subsequent backup runs, `/stash-backup` is already populated so the backup process should be faster. The output you can expect to see looks something like this:

```
$ ./stash.diy-backup.sh
[http://stash.example.com:7990/stash] INFO: Prepared backup of DB stash in /stash-backup/stash-db/
building file list ... done

$
```

Restoring a DIY Backup

When restoring Stash, you must run the `stash.diy-restore.sh` script on the machine that Stash should be restored to. In order to ensure accidental restores do not delete existing data, you should never restore into an existing home directory.

The new database should be configured following the instructions in [Connecting Stash to an external database](#) and its sub-page that corresponds to your database type.

To see the available backups in your `${STASH_BACKUP_ARCHIVE_ROOT}` directory, just type:

```
$ ./stash.diy-restore.sh
```

You should see output similar to this:

```
$ ./stash.diy-restore.sh
Usage: ./stash.diy-restore.sh <backup-file-name>.tar.gz
Available backups:
stash-20140320-092743-063.tar.gz stash-20140320-093043-243.tar.gz stash-20140320-135235-955.tar.gz
stash-20140320-092941-181.tar.gz stash-20140320-093333-413.tar.gz stash-20140320-142649-009.tar.gz
$
```

To restore a backup, run `stash.diy-restore.sh` with the file name as the argument:

```
$ ./stash.diy-restore.sh stash-20140320-092743-063.tar.gz
```

You should see output like this:

```
$ ./stash.diy-restore.sh stash-20140320-092743-063.tar.gz
[http://stash.example.com:7990/stash] INFO: Extracted /stash-backup-archives/stash-20140320-092743-063.tar.gz into
[http://stash.example.com:7990/stash] INFO: Performed restore of /stash-backup/stash-db/ to DB stash
[http://stash.example.com:7990/stash] INFO: Performed restore of /stash-backup/stash-home/ to /stash-home
$
```

Cancelling the backup

You can cancel the running backup operation if necessary.

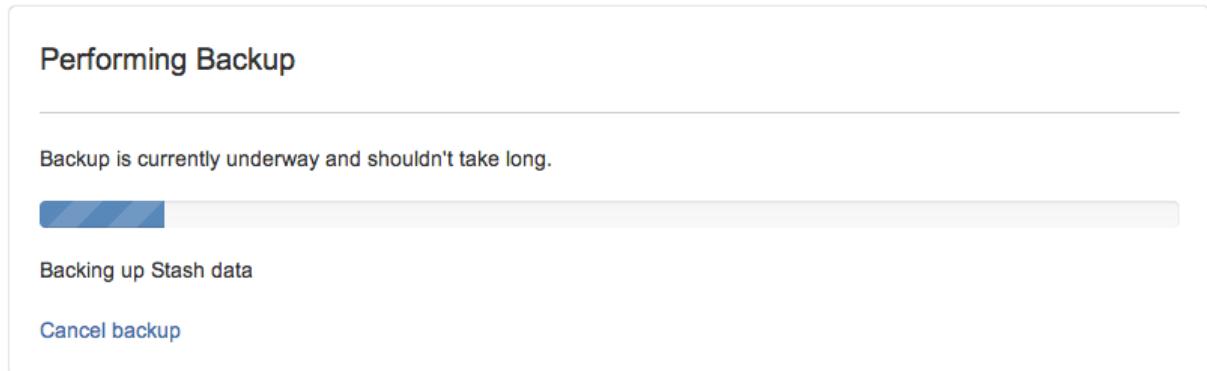

To cancel the backup:

1. Copy the cancel token echoed in the terminal (or the Command Prompt on Windows):

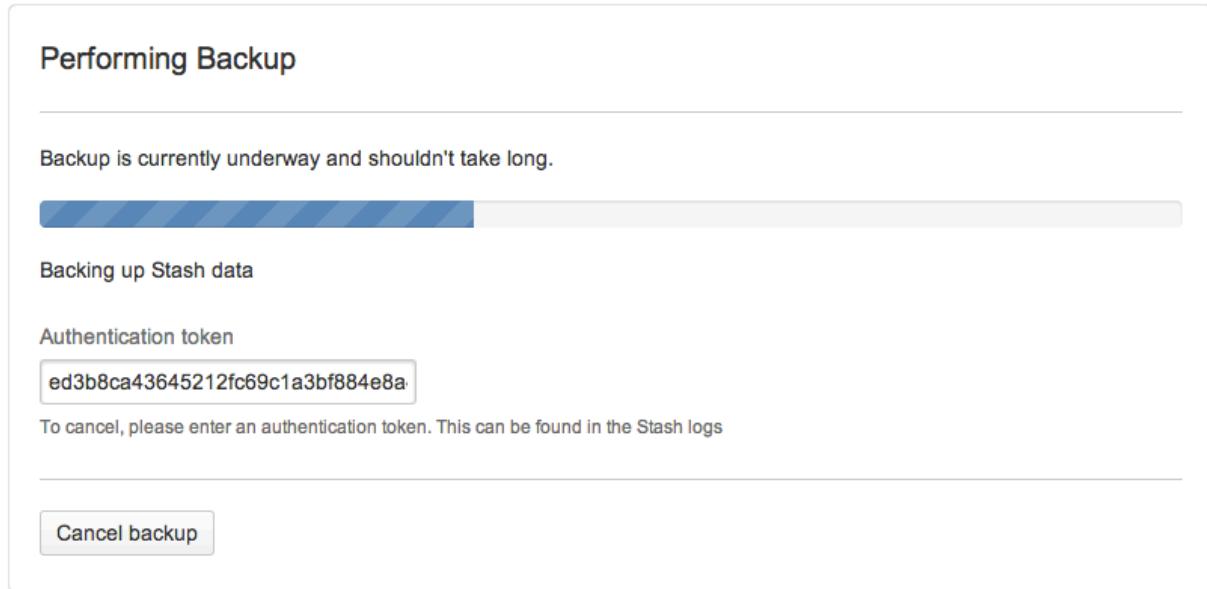

```
$ ./stash.diy-backup.sh
[http://stash.example.com:7990/stash] INFO: Prepared backup of DB stash in /stash-backup/stash-db/
building file list ... done
stash-home -> /stash-home

sent 115 bytes received 26 bytes 282.00 bytes/sec
total size is 52 speedup is 0.37
[http://stash.example.com:7990/stash] INFO: Prepared backup of /stash-home to /stash-backup/stash-home/
[http://stash.example.com:7990/stash] INFO: locked with '95261b2497ha854d103aff9e294a9d87h3f2ec54'
[http://stash.example.com:7990/stash] INFO: backup started with 'ed3b8ca43645212fc69c1a3bf884e8a425477d24'
[http://stash.example.com:7990/stash] .INFO: Waiting for DRAINED state.done
[http://stash.example.com:7990/stash] INFO: db state 'DRAINED'
[http://stash.example.com:7990/stash] INFO: scm state 'DRAINED'
```

2. Go to the Stash interface in your browser. Stash will display this screen:

3. Click **Cancel backup**, and enter the cancel token:

4. Click **Cancel backup**.

Advanced - writing your own DIY Backup using the REST APIs

i This section is optional and provides background information about how you might use the Stash REST APIs if you need to rewrite the DIY Backup scripts described above in your preferred language or to customize them heavily.

Note that this discussion shows `curl` commands in Bash, however you can use any language.

The following steps are involved:

Preparation

Before you lock Stash you can perform any preparation you like. It makes sense to perform as much processing as possible before you lock Stash, to minimize downtime later. For example, you could perform

an rsync:

```
rsync -avh --delete --delete-excluded --exclude=/caches/ --exclude=/data/db.*  
--exclude=/export/ --exclude=/log/ --exclude=/plugins/.*/ --exclude=/tmp  
--exclude=/.lock ${STASH_HOME} ${STASH_BACKUP_HOME}
```

Lock the Stash instance

The next step in making a backup of a Stash instance is to lock the instance for maintenance. This can be done using a POST request to the /mvc/maintenance/lock REST point (where STASH_URL points to the Stash instance, STASH_BACKUP_USER is a Stash user with backup permissions, and STASH_BACKUP_PASS is this user's password).

REQUEST

```
curl -s \  
-u  
${STASH_BACKUP_USER}:${STASH_BACKU  
P_PASS} \  
-X POST \  
-H "Content-type:  
application/json" \  
  
"${STASH_URL}/mvc/maintenance/lock  
"
```

RESPONSE

```
{  
  "unlockToken": "0476adeb6cde3a41aa  
0cc19fb394779191f5d306",  
  "owner": {  
    "displayName": "admin",  
    "name": "admin"  
  }  
}
```

If successful, the Stash instance will respond with a 202 and will return a response JSON similar to the one above. The unlockToken should be used in all subsequent requests where \$STASH_LOCK_TOKEN is required. This token can also be used to manually unlock this Stash instance.

Start the backup process

Next, all connections to both the database and the filesystem must be drained and latched. When backing up the database, we have two options:

- Use the facilities provided by the Stash server – your code handles backing up of the filesystem and Stash backs up the database.
- Do a completely custom back up of the database – your code must handle backing up of *both* the filesystem and the database.

Both options make a POST request to /mvc/admin/backups but if we require a custom database backup (the second option) we need to add the ?external=true parameter (requires Stash 2.12+):

REQUEST

```
curl -s \
-u
${STASH_BACKUP_USER}:${STASH_BACKUP_PASS} \
-X POST \
-H
"X-Atlassian-Maintenance-Token:
${STASH_LOCK_TOKEN}" \
-H "Accept: application/json" \
-H "Content-type:
application/json" \
"${STASH_URL}/mvc/admin/backups?external=true"
```

RESPONSE

```
{
  "id": "d2e15c3c2da282b0990e8efb30b4bfffbcf09e04",
  "progress": {
    "message": "Closing connections to the current database",
    "percentage": 5
  },
  "state": "RUNNING",
  "type": "BACKUP",
  "cancelToken": "d2e15c3c2da282b0990e8efb30b4bfffbcf09e04"
}
```

If successful the Stash instance will respond with 202 and a response JSON similar to the one above will be returned. The `cancelToken` can be used to manually cancel the back up process.

- i** If you use Stash to back up your database (i.e., you POST to `/mvc/admin/backups` *without* the `?external=true` parameter), Stash will save the complete database backup (in a vendor independent format) to a file name of the form

```
${STASH_HOME}/export/backup-admin-20140325-223629-897Z.zip
```

Your backup process must include this file in the final archive.

Wait for the Stash instance to complete preparation

Part of the back up process, even if Stash is doing a database backup, includes draining and latching the connections to the database and the filesystem. Before continuing with the back up we have to wait for the Stash instance to report that this has been done. To get details on the current status we make a GET request to the `/mvc/maintenance` REST point.

REQUEST

```
curl -s \
-u
${STASH_BACKUP_USER}:${STASH_BACKUP_PASS} \
-X GET \
-H
"X-Atlassian-Maintenance-Token:
${STASH_LOCK_TOKEN}" \
-H "Accept: application/json" \
-H "Content-type:
application/json" \
"${STASH_URL}/mvc/maintenance"
```

RESPONSE

```
{  
  "task": {  
  
    "id": "0bb6b2ed52a6a12322e515e88c5d  
    515d6b6fa95e",  
    "progress": {  
      "message": "Backing up Stash  
      home",  
      "percentage": 10  
    },  
    "state": "RUNNING",  
    "type": "BACKUP"  
  },  
  "db-state": "DRAINED",  
  "scm-state": "DRAINED"  
}
```

This causes the Stash instance to report its current state. We have to wait for both `db-state` and `scm-state` to have a status of `DRAINED` before continuing with the back up.

Perform the actual backup

At this point we are ready to create the actual backup of the Stash filesystem. For example, you could use `rsync` again:

```
rsync -avh --delete --delete-excluded --exclude=/caches/ --exclude=/data/db.*  
--exclude=/export/ --exclude=/log/ --exclude=/plugins/.*/ --exclude=/tmp  
--exclude=/.lock ${STASH_HOME} ${STASH_BACKUP_HOME}
```

The `rsync` options shown here are for example only, but indicate how you can include only the required files in the backup process and exclude others. Consult the documentation for `rsync`, or the tool of your choice, for a more detailed description.

When creating the database backup you could use your vendor-specific database backup tool, for example `pg_dump` if you use PostgreSQL:

```
pg_dump -Fd ${STASH_DB} -j 5 --no-synchronized-snapshots -f ${STASH_BACKUP_DB}
```

While performing these operations, good practice is to update the Stash instance with progress on the backup so that it's visible in the UI. This can be done by issuing a `POST` request to `/mvcc/admin/backups/progress/client` with the token and the percentage completed as parameters:

REQUEST

```
curl -s \
-u ${STASH_BACKUP_USER}:${STASH_BACKUP_PASS} \
-X POST \
-H "Accept: application/json" \
-H "Content-type: application/json"

"${STASH_URL}/mvc/admin/backups/progress/client?token=${STASH_LOCK_TOKEN}&percentage=${STASH_BACKUP_PERCENTAGE}"
```

The Stash instance will respond to this request with an empty 202 if everything is OK.

The amount of progress that Stash displays to users is calculated differently, depending on whether you used the `external=true` parameter with the `/mvc/admin/backups` REST endpoint described in the section above.

- If you did *not* specify `external=true`, Stash backs up the database and divides the 100 per cent progress into 50% user DIY Backup, and 50% Stash (preparation + database).
- If you did specify `external=true`, your code must handle backing up of *both* the filesystem and the database, and Stash divides the 100 per cent progress into 90% user DIY Backup, and 10% Stash preparation.

Inform the Stash instance that the backup is complete

Once we've finished the backup process we must report to the Stash instance that progress has reached 100 percent. This is done using a similar request to the progress request. We issue a `POST` request to `/mvc/admin/backups/progress/client` with the token and 100 as the percentage:

REQUEST

```
curl -s \
-u ${STASH_BACKUP_USER}:${STASH_BACKUP_PASS} \
-X POST \
-H "Accept: application/json" \
-H "Content-type: application/json"

"${STASH_URL}/mvc/admin/backups/progress/client?token=${STASH_LOCK_TOKEN}&percentage=100"
```

The Stash will respond with an empty 202 if everything is OK. The back up process is considered completed once the percentage is 100. This will unlatch the database and the filesystem for this Stash instance.

Unlock the Stash instance

The final step we need to do in the back up process is to unlock the Stash instance. This is done with a `DELETE` request to the `/mvc/maintenance/lock` REST point:

REQUEST

```
curl -s \
-u ${STASH_BACKUP_USER}:${STASH_BACKUP_PASS} \
-X DELETE \
-H "Accept: application/json" \
-H "Content-type: application/json" \
"${STASH_URL}/mvc/maintenance/lock?token=${STASH_LOCK_TOKEN}"
```

The Stash instance will respond to this request with an empty 202 if everything is OK, and will unlock access.

Lockout recovery process

This page describes how to recover administrator access to Stash 2.11+. For releases prior to that, please refer to [Restoring the Stash Administrator's Password](#).

As an administrator, you find yourself locked out of Stash and unable to log in. This situation can arise when all users are managed externally from Stash, and Stash becomes unable to access those user directories for some reason, including:

- The external user directory server is not accessible (because the network is down, or the directory is down, or the directory has been moved to another IP address)
- Users are managed in JIRA and the Application Link from Stash to JIRA has been accidentally deleted
- The admin password has been forgotten or lost
- The admin account is shaded by a remote account in an LDAP or JIRA instance that is connected to Stash but which is unavailable.

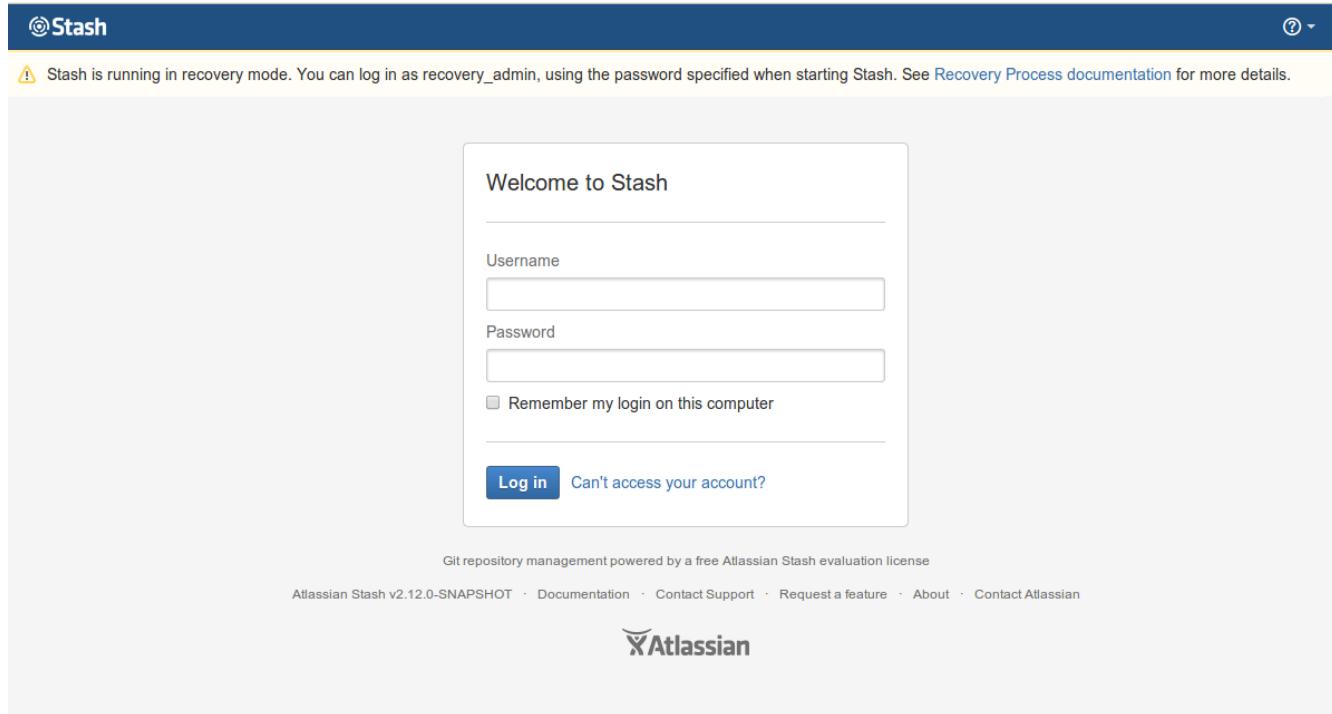

The lockout recovery process for Stash is:

1. Edit the <Stash installation directory>\bin\setenv.sh file (or setenv.bat on Windows) and add the "-Datlassian.recovery.password=temporarypassword" argument to the JVM_SUPPORT_RECOMMENDED_ARGS property. The property value must be non-blank, and should look like this when you've done that:

```
#  
# Occasionally Atlassian Support may recommend that you set some specific JVM arguments. You can use this variable  
# below to do that.  
#  
JVM_SUPPORT_RECOMMENDED_ARGS="-Datlassian.recovery.password=temporarypassword"
```

Here we are using "temporarypassword", but you can use your own value.

2. Start Stash.
3. Log in to Stash using the 'recovery_admin' username and the temporary password specified in Step 1.
4. Repair your Stash configuration. We strongly recommend that you do not perform other actions while Stash is in recovery mode.
5. Confirm your ability to log in with your usual admin profile.
6. Shut down Stash, remove the atlassian.recovery.password argument from setenv.sh, and restart Stash as usual.

Using diff transcoding in Stash

As of Stash 3.1, Stash supports transcoding for diffs. This allows Stash to convert files in encodings like EUC-JP, GB18030 and UTF-16 to UTF-8, so they are processed correctly by `git diff`, which only supports UTF-8. Similar transcoding has been applied to Stash's source view since it was released, so this change brings the diff view in line with the source view. Diff transcoding is applied to commit and pull request diffs, as well as the diff-to-previous view.

⚠️ Git for Windows, formerly known as msysgit, has known issues with Unicode paths. Diff transcoding works on all supported versions of Git for Windows, but 1.8.0 or higher is required to support Unicode paths.

Enabling diff transcoding

Diff transcoding must be explicitly enabled for each repository (unlike source view transcoding, which is always performed).

Repository administrators can enable diff transcoding on the repository settings page:

Repository details

Name Changing this repository's name will change its clone URL.

Location on disk /opt/...

Size 322.57 MB

Attachments 9.50 MB

Default branch Select the default branch for browsing the repository.

Allow forks Clear the checkbox to prevent forking of this repository

Transcode diffs Transcode diffs, allowing non-UTF-8 diffs to be displayed

Performance and scaling

There's a performance consideration with transcoding. It is implemented using Git's `textconv` support, so using it adds overhead to displaying diffs. Where possible, the best approach, given `git` only supports UTF-8 content, is to use UTF-8 encoding so that transcoding is not necessary. In repositories without non-UTF-8 content, diff transcoding should be left disabled. Other encodings are often a necessity, however, and for repositories containing such content enabling diff transcoding allows using the full range of Stash features.

▼ [Click here to read more...](#)

When transcoding is enabled, `git diff` writes the before and after blobs to temporary files and invokes the `textconv` script once for each file. The script Stash installs uses Perl to send a request back to Stash with the path to each temporary file. Stash then opens each file, detects the encoding using the same algorithm the source view uses, converts the file to UTF-8 and streams it out for `git diff` to use. After `git diff` has invoked the `textconv` script the temporary files it created are deleted.

Writing the blobs to disk, starting Perl and calling back into Stash are all overhead processing compared to performing a diff without transcoding. How much overhead that is varies by the size of the diff. When nominally-sized files containing two or three thousand lines or less are being compared the overhead is minuscule, under 50 milliseconds on an average server. However, when comparing larger files the overhead can result in a noticeable delay displaying the diff.

Releases

The following pages can be found in the latest documentation for Stash:

- the [Stash upgrade guide](#)
- the [Stash security advisories](#)
- the [End of support announcements for Stash](#)
- the [full release notes for every Stash release](#).

You can get automated notifications about major Stash releases by subscribing to the [Atlassian dev tools blog](#).

The list below is a summary of the Stash releases. The change logs included in the release notes (linked below) have details of the related bug-fix releases.

Stash 3.4

21 October 2014

- Batched email notifications
- Support for Microsoft Office and OpenOffice/LibreOffice MIME types
- Aggregated group membership option for multiple user directories
- Disabling pull request assistive URLs in the console
- JMX support

Read more in the [Stash 3.4 release notes](#) and [change log](#).

See the [Stash upgrade guide](#).

Stash 3.3

10 September 2014

- Tasks for pull requests
- Tomcat 8 is now bundled
- Pull request URLs are displayed in the console after pushing

Read more in the [Stash 3.3 release notes](#) and [change log](#).

See the [Stash upgrade guide](#).

Stash 3.2

30 July 2014

- Improved workflow for creating pull requests
- Improved comment navigation in diffs - jump to next/previous comment
- Landing page for new users
- Stash analytics disclosure

Read more in the [Stash 3.2 release notes](#) and [change log](#).

See the [Stash upgrade guide](#).

Stash 3.1

24 June 2014

- Code search in pull request diffs
- Attachments for pull request comments and descriptions
- Stash installer for Linux, Mac OS X and Windows
- Microsoft SQL Server 2014 is now supported
- Oracle 12c is now supported
- Transcoding is now supported for diff views

Read more in the [Stash 3.1 release notes](#) and [change log](#).

See the [Stash upgrade guide](#).

Stash 3.0

20 May 2014

- Branch compare
- Sidebar redesign
- Webcam capture of user avatars
- Stash internationalization
- Java 6 support removed. Stash now requires Java 7 at least.
- Java 8 is now supported.
- Internet Explorer 8 support removed.
- Stash JavaScript API published

- Stash APIs deprecated in Stash 2.x releases (before 2.12) have now been removed.

Read more in the [Stash 3.0 release notes and change log](#).

See the [Stash upgrade guide](#).

Stash 2.12

25 March 2014

- Custom avatar images
- User name linking to profile page
- Read/write access keys
- Access key bulk revocation
- Diff hunk map
- DIY Backup
- Comment display toggling
- Markdown rendering in the Source view
- Markdown table syntax in comments

Read more in the [Stash 2.12 release notes and change log](#).

See the [Stash upgrade guide](#).

Stash 2.11

25 February 2014

- Commit comments
- File comments for pull requests and commits
- Side-by-side diffs
- Lock out recovery process
- MySQL 5.6.16+ support

Read more in the [Stash 2.11 release notes and change log](#).

See the [Stash upgrade guide](#).

Stash 2.10

17 December 2013

Small improvements:

- [Branch Utils REST API](#)
- The SSH clone URL is now shown for admins who don't have a user key, when a project or repository access key is available
- The permission screens for projects and repositories have been tidied
- Log files in Stash now use UTF-8 encoding when you start Stash from IDEA or Maven
- The URL now updates correctly when you switch revisions via the file history, when viewing the 'Diff to previous' tab for a repo
- Stash has been updated to use [AUI 5.3](#)
- Atlassian platform upgrade for 2.10

Read the [Stash 2.10 release notes and change log](#).

Stash 2.9

19 November 2013

- Branch listing improvements
- SSH access keys for projects and repositories
- Pull request inbox – my pull requests
- Build status during branch creation

- Support for PostgreSQL 9.3
- Extra keyboard shortcuts
- Extra merge strategy option
- Support for changing usernames

Read the [Stash 2.9 release notes and change log](#).

Stash 2.8

1 October 2013

- Stash branching model
- Branch creation from within Stash
- Branch creation from within JIRA
- Automated merges
- Branch listing page
- Move Git repositories between Stash projects
- Improved integration with Atlassian SourceTree
- Small improvements

Read the [Stash 2.8 release notes and change log](#).

Stash 2.7

20 August 2013

- JIRA issue transitions
- Support for multiple JIRA instances
- Autolink JIRA issues in markdown
- Backup and restore client (beta)
- Small improvements

Read the [Stash 2.7 release notes and change log](#).

Stash 2.6

22 July 2013

- Fork synchronisation
- Audit logging
- Repository Quicksearch
- Application navigator
- Public repositories list
- Small improvements

Read the [Stash 2.6 release notes and change log](#).

Stash 2.5

12 June 2013

- Public access to projects and repositories
- Edit a pull request's destination branch
- Get more context in diffs
- OpenJDK is now supported
- Small improvements

Read the [Stash 2.5 release notes and change log](#).

Stash 2.4

6 May 2013

- Forks
- Repository permissions
- Personal repositories
- Small improvements
- Deprecation of Java 6

Read the [Stash 2.4 release notes and change log](#).

Stash 2.3

26 March 2013

- Crowd single sign-on (SSO)
- Branch deletion
- Git submodule recognition
- SCM Cache plugin for Stash

Read the [Stash 2.3 release notes and change log](#).

Stash 2.2

05 March 2013

- Git repository hooks
- API for hook integrations
- Merge checks for pull requests

Read the [Stash 2.2 release notes and change log](#).

Stash 2.1

05 February 2013

- Pull request integration with JIRA
- Build status API
- Project avatars
- Pull request inbox
- Improved pull request title and description generation

Read the [Stash 2.1 release notes](#).

See the [change log](#) for Stash 2.1.x minor releases.

Stash 2.0

04 December 2012

- Branch permissions
- Markdown support
- Mentions
- Enterprise licenses for 1000 and 2000 users
- Deprecation of Internet Explorer 8

Read the [Stash 2.0 release notes](#).

See the [change log](#) for Stash 2.0.x minor releases.

Stash 1.3

09 October 2012

- Pull requests
- Notifications
- Improved keyboard shortcuts

- README – simple project documentation

Read the [Stash 1.3 release notes](#).

See the [change log](#) for Stash 1.3.x minor releases.

Stash 1.2

07 August 2012

- MySQL, PostgreSQL, SQL Server and Oracle support
- Database migration
- File search
- Add-ons ecosystem
- Small improvements

Read the [Stash 1.2 release notes](#).

See the [change log](#) for Stash 1.2.x minor releases.

Stash upgrade guide

This page describes how to upgrade Stash from a previous version.

- For the latest and greatest Stash release, see [Releases](#).

For production environments we recommend that you test the Stash upgrade on a QA server before deploying to production.

Please also read:

- the [Supported platforms](#) page for the full list of supported platforms for Stash.
- the [End of support announcements for Stash](#).
- the [Integrating Stash with Atlassian applications](#) page for version compatibility information.

On this page:

- [Upgrade steps](#)
- [Upgrading to Stash 3.4](#)
- [Upgrading to Stash 3.3](#)

Upgrade steps

Upgrading to Stash 3.2 is irreversible – once you upgrade to Stash 3.2 you can not revert to an earlier version, because of changes to the Stash home directory format that are made by Stash 3.2. Please see the [Home directory migration](#) section below.

This section provides general instructions for upgrading Stash. See also the specific notes on this page for the version of Stash you are upgrading to. We *strongly recommend* that you upgrade Stash by following these steps:

1. Back up your Stash data!

See [Data recovery and backups](#) for more information.

2. Stop Stash!

How you stop Stash depends on whether it is running as a service, and the platform on which Stash is running.

See [Starting and stopping Stash](#).

3. Download and install Stash

Use either the Stash [installer](#) (recommended) or install Stash from an [archive](#) file, as described in separate sections below.

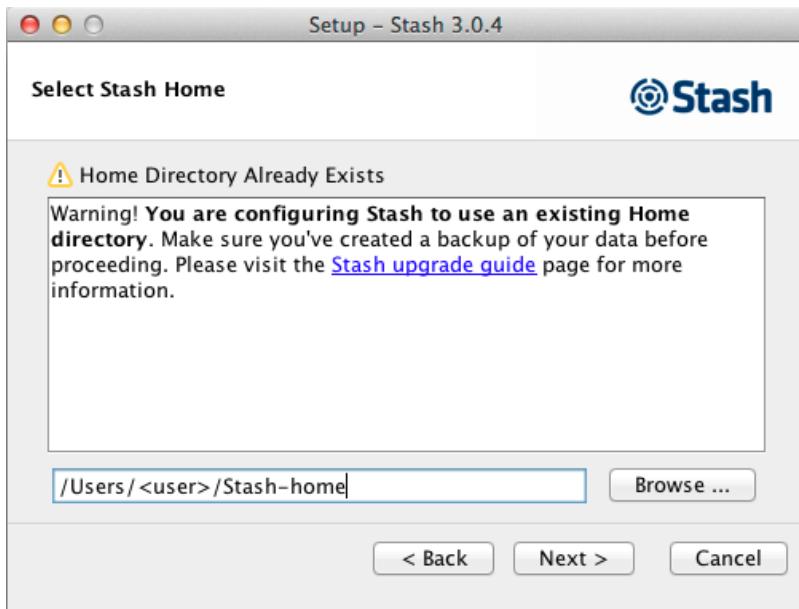

Use the Stash installer to upgrade your Stash installation

[Download Stash](#) from the Atlassian download site and run the installer. This is the recommended approach. Note that installer does *not* perform an in-place upgrade, but installs the new version of Stash into a fresh directory – see [Running the Stash installer](#).

At the 'Select Stash Home' step, browse to your existing Stash home directory (as defined by the `STASH_HOME` variable – see [Stash home directory](#)):

The installer checks the location you provide; if it is a Stash home directory the installer displays a reminder about backing up your data (for existing installs of Stash 2.6 or later):

Proceed with the remaining installer steps.

Use an archive file to upgrade your Stash installation

Follow the instructions at [Installing Stash from an archive](#).

Note that you should *not* simply unzip the Stash archive file over an existing Stash installation – that will *always* corrupt the system. This is because each version of Stash includes versioned jar files, such as `stash-model-2.4.1.jar`. If you copy these, you end up with multiple versions of Stash's jar files in the classpath, which leads to runtime corruption.

4. Update any custom configurations

If you made custom changes to the configuration of your existing Stash installation you will have to make these changes for the new installation as well. For example:

- You may have made changes to the port, context path, and/or access protocol (`conf/server.xml`).
- You may be running Stash behind a proxy and have modified the Connector element (`conf/server.xml`).
- You may be using 64-bit libraries on Windows instead of the out-of-the-box 32-bit libraries (`bin/tomcat7.exe`, `bin/tcnative-1.dll`).

Do not simply copy the configuration files from your existing Stash installation to your new installation.

Carefully review the differences between your customized version and the default version and re-apply your custom changes to the new configuration files to prevent overwriting configuration changes between different versions of Stash.

If you are using MySQL

Stash does not ship with the MySQL database driver.

You need to [reinstall the driver](#) in the new installation, or copy the previous driver from the old <Stash installation directory>/lib to the new <Stash home directory>/lib.

5. Start Stash

If you installed Stash using the installer, Stash will already have been started by the installer.

If you [installed Stash manually](#) from an archive file then see [Starting and stopping Stash](#).

Either way, note that the database schema migration task that runs when Stash is started after an upgrade can take a while, especially if the upgrade has skipped a few releases (for example, upgrading from

Stash 2.2 to 2.7). Stash should never be interrupted while this is happening, even if Stash appears to have hung – allow the server to either come up, or fail to come up (when it will provide an explanation of what went wrong).

6. Rollback

If necessary, rolling back an upgrade should only be performed by restoring a backup of *both* the Stash [home directory](#) and the Stash database – rolling back requires a consistent home directory and database. You can then reinstall the previous version of Stash to the <Stash installation directory>.

Upgrading to Stash 3.4

Please also see:

- the general [Upgrade steps](#) section above.
- the [Stash 3.4 release notes](#).
- the [Stash Supported platforms](#) page. Note that Stash 3.4 [does not support Git 2.0.2 or 2.0.3](#).
- the [End of support announcements for Stash](#).

Changed group membership aggregation with multiple user directories

Stash 3.4 uses new schemes to determine the effective group memberships when Stash is connected to multiple user directories, and duplicate user names and group names are used across those directories. The new schemes are:

- 'aggregating membership'
- 'non-aggregating membership'.

These group membership schemes are only used to determine authorisation. Authentication is determined on the basis of the group mappings in each directory.

See [Effective memberships with multiple directories](#) in the Crowd documentation for more information.

When you upgrade to Stash 3.4, an upgrade task will apply one of those schemes as follows:

Aggregating membership will be applied to your instance:

- If there is only one active directory.
- If there are multiple active directories but only a single directory applies group memberships to any particular user.
- For example, if directory-1 contains user-a in group-x, and directory-2 contains user-b in group-y, then Stash 3.4 will apply aggregating membership, and permissions will not be affected.

Non-aggregating membership will be applied to your instance:

- If there are multiple active directories and more than one directory applies group memberships to at least one user.
- For example, if directory-1 contains user-a in group-x, and directory-2 contains user-a in group-y, then Stash 3.4 will apply non-aggregating membership. If group-y has admin privileges then user-a would have their privileges escalated in this case if aggregating membership was applied instead when upgrading to Stash 3.4.

Any changes made by the upgrade task will be logged.

A Stash admin can change the membership scheme used by Stash using the following commands:

- To change to *aggregating membership*, substitute your own values for <username>, <password> and <base-url> in this command:

```
curl -H 'Content-type: application/json' -X PUT -d
'{"membershipAggregationEnabled":true}' -u <username>:<password>
<base-url>/rest/crowd/latest/application
```

- To change to *non-aggregating membership*, substitute your own values for <username>, <password>

> and <base-url> in this command:

```
curl -H 'Content-type: application/json' -X PUT -d
'{"membershipAggregationEnabled":false}' -u <username>:<password>
<base-url>/rest/crowd/latest/application
```

Please note that changing the aggregation scheme can affect the authorisation permissions for your Stash users, and how update operations are performed. Read more about using Stash with [multiple use directories](#).

[10 issues](#)

Upgrading to Stash 3.2

Upgrading to Stash 3.2 is irreversible – once you upgrade to Stash 3.2 you can not revert to an earlier version, because of changes to the Stash home directory format that are made by Stash 3.2. Please see the [Home directory migration](#) section below.

Please also see:

- the general [Upgrade steps](#) section above.
- the [Stash 3.2 release notes](#).
- the [Stash Supported platforms](#) page.
- the [End of support announcements for Stash](#).

Note that:

- Stash 3.2 does not support Git 2.0.2 or 2.0.3.

Home directory migration

When you upgrade to Stash 3.2, an upgrade task runs that migrates directories in your Stash home directory to new locations.

For most installations, Stash 3.2 is able to perform these moves automatically and transparently. However, in the rare instance where Stash 3.2 can't perform the upgrade automatically, please refer to [Upgrading your Stash home directory for Stash 3.2 manually](#).

Undocumented home directory overrides are no longer supported

Before Stash 3.2 it was possible to override the location of the following subfolders in the Stash home directory, using undocumented environment variables or system properties:

- | | | |
|----------|--------------|-----------|
| • export | • data | • plugins |
| • bin | • lib | • tmp |
| • caches | • lib/native | |
| • config | • log | |

In Stash 3.2 only the `tmp` subfolder can be overridden in this way. Attempting to override the others will fail on startup. For more information, please see [Stash fails to start - UnsupportedDirectoryOverrideException](#).

Stash analytics

Stash 3.2, and later, collects user event data, unless this is disabled by an administrator. You will see outgoing network traffic to [amazonaws.com](#). See [Collecting analytics for Stash](#).

4 issues

Upgrading to Stash 3.0

Stash no longer supports Java 6

Stash 3.0 requires at least Java 7, and supports Java 8.

Please see the [End of support announcements for Stash](#).

Your plugins may not be compatible with Stash 3.0

The interfaces in the Stash API for plugin developers that were *deprecated* in Stash 2.11 and earlier *have been removed* in Stash 3.0. This means that, unless they have been updated to work with Stash 3.0, existing Stash add-ons (or plugins) that use these interfaces **will not work with Stash 3.0**.

Please see the section below about Stash add-on incompatibilities for more details.

Please also see:

- the general [Upgrade steps](#) section above.
- the [Stash 3.0 release notes](#).
- the [Stash Supported platforms](#) page.

Note that:

- Stash now has installers for the Linux, Mac OS X and Windows platforms.
- Stash no longer supports Internet Explorer 8, as [previously announced](#).
- Stash does not support the Apache HTTP Server `mod_auth_basic` module.
- Stash **does not support** Git 2.0.2 or 2.0.3.

Stash add-on incompatibilities

Unless they have been updated to work with Stash 3.0, existing Stash add-ons (or plugins) that use the API interfaces that have been removed in Stash 3.0 **will not work**.

Fresh installs of Stash 3.0 shouldn't encounter any problems. The Stash 'Manage add-ons' page (in the admin area) should only display add-ons from the Marketplace that have been marked as compatible with Stash 3.0. Incompatible add-ons won't be available in the list.

However, if you are upgrading from Stash 2.x to Stash 3.0, you should be aware that some existing installed add-ons may be incompatible with Stash 3.0. After upgrading, you should go to **Admin > Manage add-ons**, look for messages of this form, and follow the advice to update:

A newer version of the Universal Plugin Manager is available. [Update Now](#)

[Skip this version](#) [Remind me later](#)

If no newer version is available, the add-on must be disabled.

Custom add-ons

Please note that your custom locally-developed plugins may be affected by the API removals in Stash 3.0. You will need to update your custom plugins if you want those to work with Stash 3.0. See the [Stash API changelog](#) for details of the deprecated APIs.

Third-party add-ons

You'll need to check on Atlassian Marketplace for the compatibility status of any 3rd-party add-ons that you use.

Third-party add-on developers have been given an Early Access Program (EAP) build of Stash 3.0 in advance of release, and many have already updated their add-ons to be compatible. Add-ons must be explicitly marked by the publisher as compatible with Stash 3.0 for them to appear in 'Manage add-ons' page in Stash. ***This is NOT automatic as was the case with previous minor releases such as 2.10 and 2.11.*** Atlassian can't support issues involving third party Add-ons that are incompatible with Stash 3.0; such support cases must be directed to the third-party publisher of the add-on. See [Managing add-ons](#).

Atlassian add-ons

All of the Atlassian add-ons for Stash that are available from the Atlassian Marketplace have been updated to be compatible with Stash 3.0. If you use any of these in your Stash installation you'll need to update them to the Stash 3.0 compatible version.

| Add-on | JAR file name | Stash 3.0 compatible version |
|------------------------------------|-------------------------------------|------------------------------|
| Custom Navigation Plugin | custom-navigation-plugin | 2.0.3 |
| Stash Archive Plugin | stash-archive | 1.3.0 |
| Repository git operations plugin | stash-git-ops-plugin | 1.2.1 |
| Stash Auto Unapprove Plugin | stash-auto-unapprove-plugin | 1.1 |
| Stash Protect Unmerged Branch Hook | stash-protect-unmerged-branch-hook | 1.1 |
| Stash Reviewer Suggester | stash-suggest-reviewers | 1.2 |
| Stash Web Post Hooks Plugin | stash-web-post-receive-hooks-plugin | 1.1.0 |
| Realtime Editor for Stash | stash-editor-plugin | 1.0.6 |

1 issue

Install location for third-party libraries

As of Stash 2.1 you can install third-party libraries and jar files, such as the MySQL JDBC driver, into <Stash home directory>/lib. This has the advantage that files in this location are not overwritten, and lost, when you upgrade Stash.

Microsoft SQL Server JDBC driver

Stash 2.1 now uses the Microsoft SQL Server JDBC driver to access Microsoft SQL Server, instead of using the jTDS driver. In most cases, Stash will automatically swap to using the Microsoft driver on upgrade and **no configuration is required**.

If Stash was configured to use Microsoft SQL Server by manually entering a JDBC URL, please refer to [this guide](#).

Upgrading to Stash 2.0

This section provides specific notes for upgrading to Stash 2.0. See also the [Upgrade steps](#) section above.

Tomcat

For Stash 2.0, Tomcat has been upgraded from version 6 to 7. As part of that upgrade, the server.xml file has changed. If you have customised server.xml (for example, for port, path or hostname), you can not simply copy your own version across to the upgraded Stash; you must reapply your customisations to the server.xml file for the new version of Stash.

If you were running Stash as a Windows service and are upgrading from 1.x to 2.x you will need to reinstall

the Stash service to make it use Tomcat 7.

To uninstall the Stash service you need to execute following commands from <STASH DISTRIBUTION DIR>\bin:

```
> net stop <service name>
> service.bat uninstall <service name>
```

You can call this command without the service name if you installed the Stash service with a default name.

After the service is uninstalled you can proceed with the [Upgrade steps](#) and [Running Stash as a Windows service](#) instructions to configure Stash 2.x running as a service.

Perl

Stash 2.0 requires Perl for its branch permission functionality. If Perl is unavailable, Stash 2.0 will not start.

On Windows machines, Perl will only have been installed by the Git installer if the correct install option was chosen. See [Installing and upgrading Git](#).

Existing Git hooks

In order to support Branch Permissions, Stash 2.0 moves existing hooks in the pre-receive and post-receive folders under <STASH_HOME>/data/repositories/NNNN/hooks (where NNN is the internal repository id) to .../hooks/pre-receive.d/10_custom or .../hooks/post-receive.d/10_custom. Consequently, custom hooks that use relative path names (e.g. "./foo.sh" or "../dir/foo.sh") will be broken by the upgrade to Stash 2.0.

Deprecation of Internet Explorer 8

Support for Internet Explorer 8 is deprecated from the release of Stash 2.0. The official end-of-support date is yet to be determined. See [Supported platforms](#) for details.

Known issues

| T | Key | Summary | Status |

Upgrading to Stash 1.3

This section provides specific notes for upgrading to Stash 1.3. See also the [Upgrade steps](#) section above.

Email server

An email server must be configured in Stash so that email notifications for pull request events can be sent. Please see [Setting up your mail server](#) for details.

Upgrading from Stash 1.3 beta

▼ Click to see information about upgrading from the beta...

Stash 1.3 uses improved commenting compared to the 1.3 beta. This means that when you upgrade from the beta to Stash 1.3:

- Pull request comments made in the beta against the diff will only appear in the activity, and not in the diff, in Stash 1.3. Future comments made on the same pull request in Stash 1.3 will behave as expected.
- Reviewers, participants and watchers were added after the beta was released. After you upgrade, existing pull requests will not have participants or watchers. You can add reviewers by editing the pull requests and any future commenters will be added as a participant and watcher to the pull request as you would expect.

Known issues

| T | Key | Summary | Status |
|-------------------------------------|------------|---|----------------------|
| <input checked="" type="checkbox"/> | STASH-2744 | Pull Request race condition between push and attributed activity author | OPEN |

Developing for Stash

If you are a Stash plugin developer, please refer to our [Stash developer documentation](#).

Checking for known issues and troubleshooting the Stash upgrade

If something is not working correctly after you have completed the steps above to upgrade your Stash installation, please check for known Stash issues and try troubleshooting your upgrade as described below:

- **Check for known issues.** Known issues can be seen in the [STASH project on our issue tracker](#).
- **Stash Knowledge Base.** Sometimes we find out about a problem with the latest version of Stash after we have released the software. In such cases we publish information in the [Stash Knowledge Base](#).
- If you encounter a problem during the upgrade and cannot solve it, please create a [support ticket](#) and one of our support engineers will help you.

End of support announcements for Stash

End of support matrix for Stash

The table below summarises the end of support announcements for recent Stash releases:

| Platform/functionality | Announcement date | Stash end of support |
|-------------------------|-------------------|----------------------|
| Deprecation of Tomcat 7 | 10 September 2014 | From Stash 4.0 |

Why is Atlassian ending support for these platforms?

Atlassian is committed to delivering improvements and bug fixes as fast as possible. We are also committed to providing world class support for all the platforms our customers run our software on. However, as new versions of databases, web browsers etc. are released, the cost of supporting multiple platforms grows exponentially, making it harder to provide the level of support our customers have come to expect from us. Therefore, we no longer support platform versions marked as end-of-life by the vendor, or very old versions that are no longer widely used.

End of support announcements on this page (most recent announcements first):

- Deprecation of Tomcat 7 (announced 10 September 2014)
- Deprecation of Internet Explorer 8 (announced 22 July 2013)
- Deprecation of Java 6 (announced 9 May 2013)

Deprecation of Tomcat 7 (announced 10 September 2014)

In version 4.0, Stash will no longer support Tomcat 7, and will only support Tomcat 8 and above. Stash 4.0 is expected to be released around mid-2015. See [Supported platforms](#).

Deprecation of Internet Explorer 8 (announced 22 July 2013)

In version 3.0, Stash will no longer support Internet Explorer 8, and will only support Internet Explorer 9 and above. Stash 3.0 is now expected to be released mid-2014. See [Supported platforms](#).

Deprecation of Java 6 (announced 9 May 2013)

In version 3.0, Stash will no longer support Java 6.0, and will only support Java 7.0 and above. Stash 3.0 is now expected to be released mid-2013. See [Supported platforms](#).

Stash 3.4 release notes

21 October 2014

Introducing Stash 3.4

Today we're delighted to announce the release of Stash 3.4.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Please also check the [End of support announcements for Stash](#). Add-on developers will be interested in the [API changelog](#).

The Stash 3.4 changelog is [at the bottom of this page](#).

[Try it for FREE ➔](#)

Batched email notifications

With Stash 3.4, we've taken a scalpel to our notifications engine and added email batching. What's more, we've made the notification emails more informative by putting the most important stuff at the top.

Now, *notifications will be aggregated* for each pull request and then emailed out for each recipient. The batch gets sent if things go quiet for a while (10 mins by default), or when the oldest notification gets 'stale' (30 mins by default), whichever comes first.

We think this is such a great improvement that we've made it the default, but you can change it back, in your personal account settings, if you prefer the rapid-fire pull request notifications.

Stash admins can control the batching behaviour using [system properties](#).

[Read more about notifications in Stash...](#)

The screenshot shows a Stash pull request interface. At the top, there's a summary card for a pull request titled "Feature/TIS-7654 move settings button into sidebar". It shows 1 Approval, 2 Pushes, and 5 Comments. A green "MERGED" button is visible. Below this, a list of comments is shown:

- Emma Eager pushed 2 commits**
 - b278765d Pass the appropriate property for the product deployment plugin with a long commit...
 - d458765e Use latest edition of product deployment plugin

01:53 PM
- William Wise** @max, would a new navGroup do this? Is that a better way to implement it?
26 August 2014 01:48 PM
- Emma Eager** We need to add that feature to Stash/Bamboo
01:40 PM
- William Wise** @max, would a new navGroup do this? Is that a better way to implement it?
01:48 PM
- Emma Eager** Does this work when non admins look at the page?
26 August 2014 01:48 PM

Small improvements

JMX support

Stash 3.4 introduces new settings in `setenv.bat` and `setenv.sh` to simplify enabling JMX.

When JMX is enabled via `setenv.bat` or `setenv.sh`, administrators can now set `jmx.enabled=true` in `stash-config.properties`. When this is enabled, Stash will publish details about itself and the major libraries it includes. This includes:

- BoneCP, publishing under `com.jolbox.bonecp`, provides database connection pool statistics
- Hazelcast, publishing under `com.hazelcast`, provides clustering details for Stash Data Center

- Hibernate, publishing under `org.hibernate.core`, provides statistics for entities, queries and cache hits/misses

In addition, for those who wish to monitor Stash's "scm-command" and "scm-hosting" tickets, when `jmx.enabled=true` is set those counts are published under `com.atlassian.stash` on a Tickets entry. For both "scm-command" and "scm-hosting" JMX provides details on:

- How many tickets are configured
- How many tickets are available
- The number of requests currently queued for a ticket
- The timestamp at which the *oldest* waiter queued for a ticket
- The timestamp of the most recently rejected ticket

Support for Microsoft Office and OpenOffice/LibreOffice MIME types

We've extended the range of supported MIME types to include the Microsoft Office and OpenOffice document and template types (i.e. docx, dotx, pptx, potx, ppsx, xlsx, xltx, odc, otc, odb, odg, otg, odf, otf, odi, oti, odp, otp, ods, ots, odt, ott, odm, oth).

Aggregated group membership option for multiple user directories

We've added the option to 'blend' group memberships when a user or group is defined in two or more user directories. This is a change to how multiple directories were handled in previous versions of Stash. See the [Stash upgrade guide](#) for information about the impact of this change.

Read more about using [multiple directories...](#)

Disabling pull request assistive URLs in the console

As of Stash 3.3, the console displays the URL to the 'Create pull request' screen in Stash after you push a new branch (or a branch with no pull requests yet). A Stash admin can disable this behaviour as follows: click **Manage add-ons** in the Stash admin area, filter for 'bundled hooks' and click that, then disable the 'print-branch-links-hook' module.

Change log

This section will contain information about the Stash 3.4 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are the highlights of all those that have been resolved for the Stash 3.4.x releases.

21 October 2014 - Stash 3.4.0

| T | Key | Summary |
|---|------------|---|
| | STASH-5308 | Stash should save a draft description when editing a pull request |
| | STASH-5013 | Add these mime types for Stash |
| | STASH-5295 | Add Microsoft Office 2007 and OpenOffice MIME Types |
| | STASH-5344 | Persistent XSS on a forked repository page |
| | STASH-5337 | Landing page uses UK version of customize |
| | STASH-5330 | Errors deleting repos in parallel |
| | STASH-5307 | HipChat repository hook icon is broken |
| | STASH-5293 | Persistent xss in comments caused by lacking escaping/encoding in ChangesetMarkupRenderer.java |
| | STASH-5280 | Analytics tries to make downloads from contacts btf-analytics.s3.amazonaws.com although switched off or privacy policy accepted |
| | STASH-5269 | IllegalStateException in DevSummarySupportInfo |
| | STASH-5246 | Branches should not auto merge from release branches to the production branch |
| | STASH-5182 | Can't cancel backups through web interface |

- STASH-5181 Hipchat token unauthorized if hipchat server url has a trailing forward slash
- STASH-5086 Pull request list - reviewers no longer sorted (random on every page load)
- STASH-5057 Clicking the Add file comment button scrolls to the wrong location
- STASH-5011 Stash crash after submitting PR comment with a lot of markdown syntax
- STASH-4895 Full log of HHH000179 warnings
- STASH-4711 Navlinks contains Google Analytics tag and key
- STASH-4680 User unable to sync LDAP/Active Directory after user rename if username already exists in another directory
- STASH-4498 Stash should show the "more reviewers" icon only if there are at least 2 reviewers that doesn't fit in limit

Tasks for pull requests

You can now use tasks in Stash to express and track actions identified during a review. You simply attach tasks to the comments you add to the pull request. We think tasks will make it much easier for developers to see what still needs to be done, and for review owners to keep track of which pull requests need attention before they can be merged.

```
269      -          if (update.getContext() != null && ObjectUtils.notEqual(t
270      -              throw new BadRequestException(i18nService.getMessage("upda
271      -          }
272  217          if (update.getCreatedDate() != null && !update.getCreatedD
```

Bryan Turner

We're still validating too hard

[Reply](#) · [Create task](#) · 2 days ago

Decrease validation in TaskResource

[Edit](#) · [Delete](#)

Read more about [tasks](#) for pull requests.

Small improvements

Tomcat 8

Stash 3.3 now bundles Tomcat 8.0.9. Tomcat 8 implements Servlet 3.1, and also switches from using blocking I/O to non-blocking I/O by default. Non-blocking I/O improves Stash's ability to scale.

Note that Stash will still run if deployed to Tomcat 7 until Stash 4, at which time a Servlet 3.1-compliant container, like Tomcat 8, will be required.

Pull request URLs are displayed in the console after pushing

To save you time, the console now displays the URL to the 'Create pull request' screen in Stash after you push a new branch (or a branch with no pull requests yet):

```
rstocker@rstocker < ABC-123-fix-bug > : ~/Projects/stash/repos/rep_1
[!] % git push -u origin HEAD
Password for 'http://admin@localhost:7990':
Counting objects: 3, done.
Delta compression using up to 8 threads.
Compressing objects: 100% (2/2), done.
Writing objects: 100% (3/3), 263 bytes | 0 bytes/s, done.
Total 3 (delta 1), reused 0 (delta 0)
remote:
remote: Create pull request for ABC-123-fix-bug:
remote:   http://localhost:7990/stash/projects/PROJECT_1/repos/rep_1/compare/commits?sourceBranch=refs/heads/ABC-123-fix-bug
remote:
To http://admin@localhost:7990/stash/scm/project_1/rep_1.git
 * [new branch]    HEAD -> ABC-123-fix-bug
Branch ABC-123-fix-bug set up to track remote branch ABC-123-fix-bug from origin.
```

You'll find that the branch and repository are already correctly selected in Stash, to make life easier still.

When pull requests already exist for the branch, links to those in Stash are displayed instead.

A Stash admin can disable this behaviour as follows: click **Manage add-ons** in the Stash admin area, filter for 'bundled hooks' and click that, then disable the 'print-branch-links-hook' module.

Change log

This section will contain information about the Stash 3.3 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

Improved workflow for creating pull requests

We've streamlined the pull request creation workflow in Stash so you can more easily preview your changes.

Clicking **Create pull request** in the sidebar, or choosing **Compare** from the Actions menu (on the Source, Commits or Branches pages) lets you choose and compare branches, all on the same page:

Select source and destination

Bryan Turner / stash SBS-func-test
Adam Ahmed committed a7919ce 4 hours ago
Stash / Stash master
James Gorman committed 083c0e6 2 hours ago
Create pull request

Diff Commits

| Author | Commit | Message | Commit Date | Issues |
|------------|-----------|---|-------------|---------------|
| Adam Ahmed | a7919ce | STASHDEV-6249: Failing SBS diff func tests. | 4 hours ago | STASHDEV-6249 |
| Adam Ahmed | 68459ad M | Merge remote-tracking branch 'origin/master' into SBS-... | 18 Jul 2014 | |

Read more about [using pull requests](#) in Stash.

Improved navigation in diffs

In Stash 3.0 we added keyboard shortcuts, N (next) and P (previous), to move between hunks in a diff. In Stash 3.2 you can now use keyboard shortcuts to move between comments in a diff too. Now it's easy to jump between threads, just use Shift+N (next) and Shift+P (previous). Remember, you can press ? at any time to see all Stash keyboard shortcuts.

Small improvements

Improved experience for new users

We've added a landing page that Stash displays to a new user when they log in for the first time. The landing page provides a short introduction to the key features in Stash – this helps ensure new people joining your developer team have a basic understanding of what Stash can do for them, and saves administrators having to explain the basics every time. The page can be recalled later by choosing **Welcome to Stash** from the Help menu:

Welcome to Stash
Let's get started

Familiar with Stash? [Git back to it.](#)

[Product analytics disclosure](#)

In the spirit of openness, we disclose that, as of version 3.2 Stash will collect user event data unless disabled by an administrator, per Atlassian's [Privacy Policy](#). Analytics help us to determine the frequency of feature usage within the product, all towards improving Stash.

See [Collecting analytics for Stash](#).

Change log

Stash 3.1 release notes

24 June 2014

Introducing Stash 3.1

Today we're pleased to announce the release of Stash 3.1.

Stash 3.1 brings nice enhancements to the pull request experience (code search, comment attachments, transcoding), and we're taking this opportunity to remind you about the Stash installer (available since Stash 3.0.4).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Please also check the [End of support announcements for Stash](#).

Add-on developers will be interested in the [API changelog](#).

The Stash 3.1 changelog is [at the bottom](#) of this page.

Try it for FREE

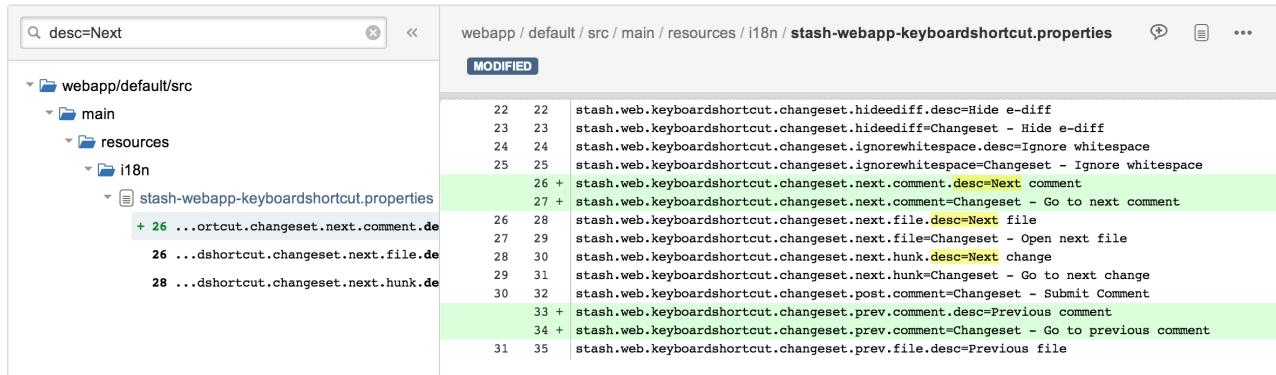

Code search in pull request diffs

We've added the ability to search across all the files in a pull request, when viewing a pull request diff.

The search is applied to the diff and surrounding context lines. The search results are highlighted, as you'd expect, and you'll notice that the file tree on the left is updated to display the files and matching lines returned

by the search.

Use the 'f' keyboard shortcut to quickly access code search when viewing a diff in a pull request. The usual 'j' (next) and 'k' (previous) keyboard shortcuts let you move between results. 'Esc' cancels the search.

```

webapp / default / src / main / resources / i18n / stash-webapp-keyboardshortcut.properties

```

Attach images to pull request comments

You can now drag and drop images, and other file types, in to your pull request comments and descriptions, so it's much easier for your team to discuss how that new UI should look. Alternatively, use the attachment button when editing the comment to upload a file from your file system, or use [markup](#) to add a resource, say from the web. Click on an image to see it at full size.

Stash administrators can use Stash config properties to control availability of this feature (`feature.attachments`) and to set the file size limit (`attachment.upload.max.size` – the default is 10 MB).

Stash installer

A Stash installer is now available (since Stash 3.0.4) for the Linux, Mac OS X and Windows operating systems. The installer can be downloaded as usual from <http://www.atlassian.com/software/stash/download>.

The installer will install a supported version of Java, if necessary, and on Linux and Windows systems, it provides the option to install Stash as a service. See [Getting started](#).

The installer can be run in GUI, console or unattended modes. See [Running the Stash installer](#) for details.

Small improvements

Microsoft SQLServer

SQL Server 2014 is now supported. See [Supported platforms](#).

Oracle

Oracle 12c is now supported. See [Supported platforms](#).

Transcoding is now supported for diff views

Diffs in Stash now support encodings other than UTF-8, for example EUC-JP, GB18030, UTF-16 and UTF-32. This means that any file that displays correctly in the source view will now display nicely in a diff view. See [Using diff transcoding in Stash](#).

See also [!\[\]\(08488c3145f5e3ad5dd01b1ecc4f01e1_img.jpg\) STASH-3179](#) - Convert non-UTF8 files to UTF8 before generating the diff view CLOSED.

Change log

This section will contain information about the Stash 3.1 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are the highlights of all those that have been resolved for the Stash 3.1.x releases.

7 October 2014 - Stash 3.1.5

Stash 3.0 release notes

20 May 2014

Introducing Stash 3.0

Today we're delighted to announce Stash 3.0, the first new major release of Stash in over a year.

Stash 3.0 brings an overhaul of the product navigation, a new way to compare branches, internationalization, and a public JavaScript API for plugin developers. Note in particular that Java 6 is no longer supported, and that previously deprecated APIs have been removed (with possible consequences for plugin compatibility) – add-on developers will be interested in the [API changelog](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Please also check the [End of support announcements for Stash](#).

The Stash 3.0 changelog is [at the bottom of this page](#).

[Try it for FREE ➔](#)

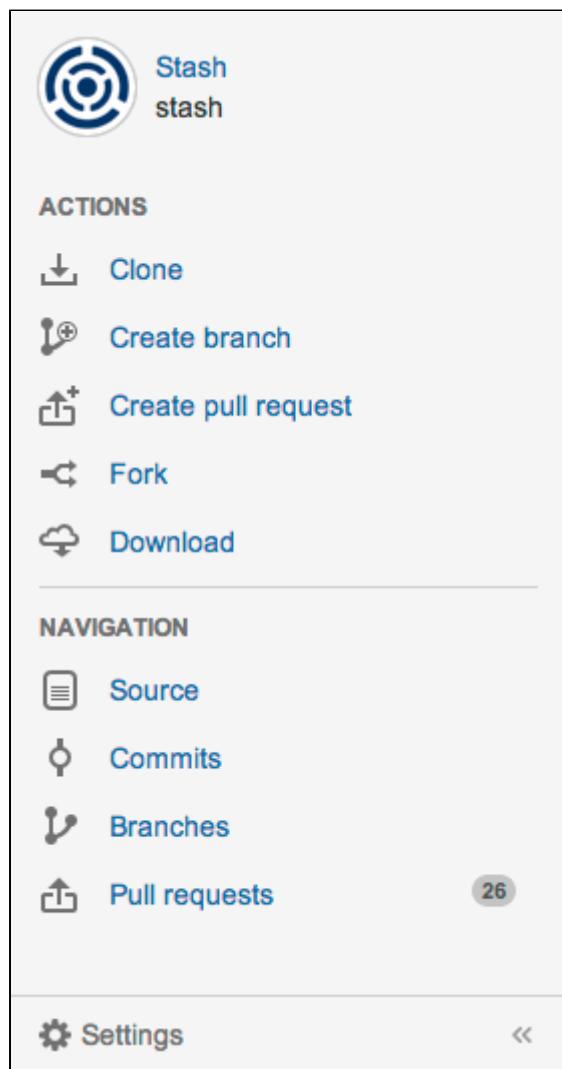

Webcam captured avatars

With [Stash 2.12](#) we introduced custom avatar images, allowing you to upload an image to your profile. Now, with Stash 3.0, we've made it possible to use your webcam to capture an avatar image directly from your **Account settings** in Stash. Looking good!

Sidebar redesign

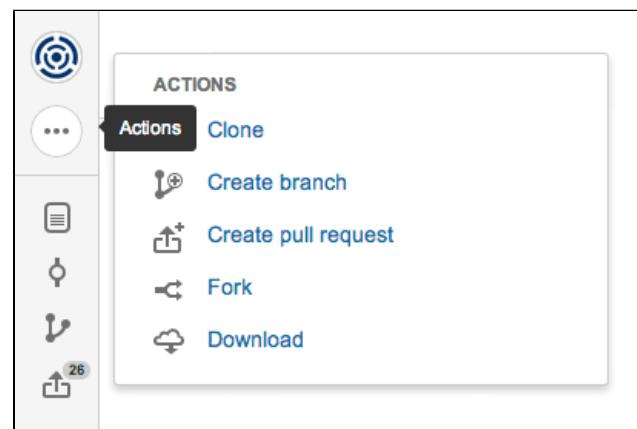

We've undertaken a major rework of the navigation for Stash 3.0.

Now, the Actions and Navigation items all live vertically in the lefthand sidebar, where it is much easier to find them. Note that **Files** has been renamed as **Source**.

Click anywhere in the sidebar, or press [, to collapse or expand it.

When the repositories sidebar is collapsed, the Actions items become available from the menu:

Branch comparisons

Now you can compare the changes between two branches, even before you start creating a pull request.

Simply click on a branch name in the **Branches** tab list or choose **Compare** from the branch actions menu on the Source, Commits or Branches screen. Then, use the project and branch pickers to choose the branches (that you have permission to see) to compare.

- The **Diff** tab shows the changes in the source branch that are not yet in the destination branch.
- The **Commits** tab shows commits on the source branch that have not yet been merged to the destination branch.

These views are very similar to those for pull requests in Stash, including the option for displaying side-by-side or unified diffs:

| Author | Commit | Message | Commit Date | Issues | Builds |
|-------------|-------------------------|---|-------------|-------------------------------|--------|
| Jason Hinch | 662593a | STASHDEV-6754: Escape all configurable colum... | 3 days ago | STASHDEV-6754 | |
| Jason Hinch | 1dfe70e | STASHDEV-6754: Add confirmationMessage an... | 3 days ago | STASHDEV-6754 | |
| Jason Hinch | 2c6afb8 | STASHDEV-6754: Fix grammar | 4 days ago | STASHDEV-6754 | |

Furthermore, when you begin creation of a pull request from the Compare screen (using the **Create pull request** action in the sidebar), the branches that you are comparing are automatically used to populate the source and destination branches for the pull request.

Read more about [pull requests in Stash...](#)

Add-on and plugin compatibility in Stash 3.0

The interfaces in the Stash API for plugin developers that were deprecated in the Stash 2.11 and earlier releases have been removed in Stash 3.0. This means that, unless they have been updated to work with Stash 3.0, existing Stash add-ons (plugins) that use these interfaces **will not work with Stash 3.0**.

In particular, please note that your custom local plugins may be affected by these API removals when you upgrade to Stash 3.0. You will need to update your custom plugins if you want those to work with Stash 3.0.

See the [Stash upgrade guide](#) for details...

New Stash JavaScript API documentation

We've published documentation for the [JavaScript API](#) for use in building your Stash plugin's UI and browser behavior. We know that plenty of developers were already using these utilities, so we're pleased to provide support for them through our [compatibility policy](#). And yes, we're going to be expanding this API over the next few releases.

Stash internationalization

Stash is now locale-aware and will be displayed in your preferred language (French, German or Japanese language packs are the first available).

Stash administrators can specify the default language at install time (in the Stash Setup Wizard), and can

install additional language packs from the Atlassian Marketplace as these become available. See [Managing add-ons](#).

You can set your preferred language in your Stash account settings – this overrides the default Stash language setting, but depends on the available language packs that are installed.

Stash selects the display language for each user session by finding the first match from the installed language packs with first, the user's language preference in their Stash account settings, then the locale set in their browser, the default Stash language setting, the Java or operating system locale, or finally US English, in that priority order.

Support for Java 6 removed

As previously announced, support for Java 6 has been removed. Stash 3.0 requires at least Java 7.

Small improvements

Java 8 supported

Stash 3.0 adds support for Java 8.

Internet Explorer 11 supported

Stash 3.0 adds support for IE 11.

Support for Internet Explorer 8 removed

As previously announced, support for IE8 has been removed in Stash 3.0.

Change log

This section will contain information about the Stash 3.0 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are the highlights of all those that have been resolved for the Stash 3.0.x releases.

7 October 2014 - Stash 3.0.8

Stash 2.12 release notes

25 March 2014

Introducing Stash 2.12

Today we're very pleased to announce Stash 2.12, which brings custom avatars, hunk maps for side-by-side diffs, enhanced SSH access keys, a new REST API for backing up and restoring Stash, and improvements to markdown rendering.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Please also check the [End of support announcements for Stash](#).

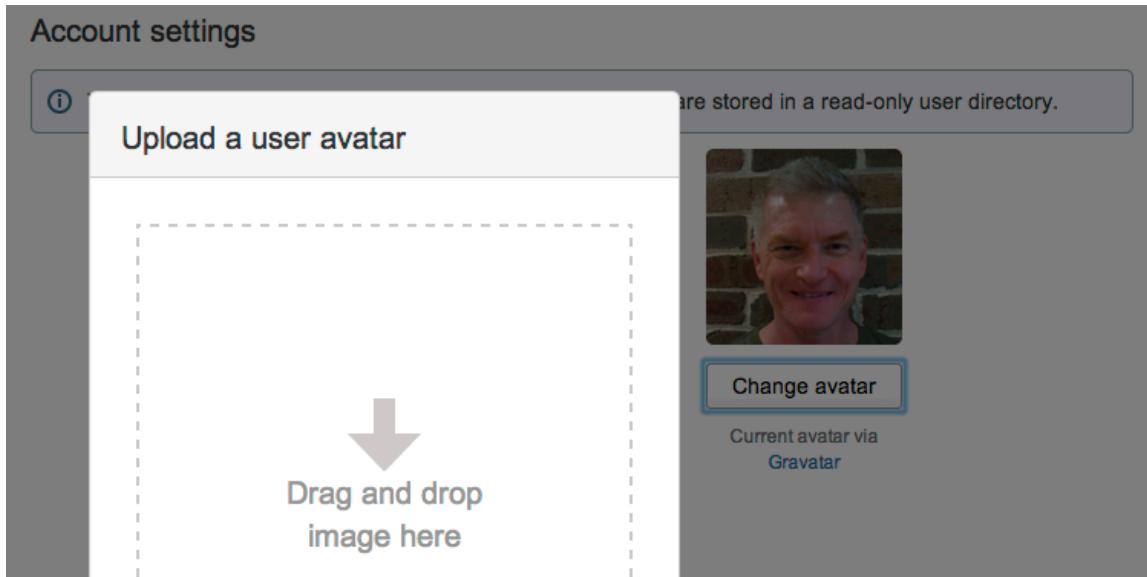

Add-on developers will be interested in the [API changelog](#).

The Stash 2.12 changelog is [at the bottom](#) of this page.

Try it for FREE ➔

Custom avatar images

You can now upload a custom avatar image to your profile, which will replace your Gravatar image wherever that is used in Stash. Do this on the **Account settings** tab in your personal profile.

User name linking

When you're logged in to Stash you'll notice that wherever commit author names are displayed (for example, on the commits list, and the blame view) they are now linked to the profile page of the author (if the author is also a Stash user). Authors are matched to Stash users via the author's email address, and the user's name in their Stash account is displayed instead of their author name.

A screenshot of the Stash commits list. At the top, there's a navigation bar with tabs: Files, Commits, Compare, Branches, Pull requests (with a badge of 15), and Settings. Below the navigation bar, a commit is listed. The commit details are: "Charles O'Farrell committed 5d5c537 2 days ago" and "STASHDEV-6188 Add missing avatar i18n properties". A red arrow points from the bottom left towards the author's name "Charles O'Farrell".

Hunk maps

We've improved how you can use side-by-side diffs, first introduced with Stash 2.11.

Now we've added a 'hunk map' to side-by-side diffs, to make it easier for you to find where a file has been changed. Simply click on the hunk map in the left- or right-hand margin to scroll the view to that location:

```

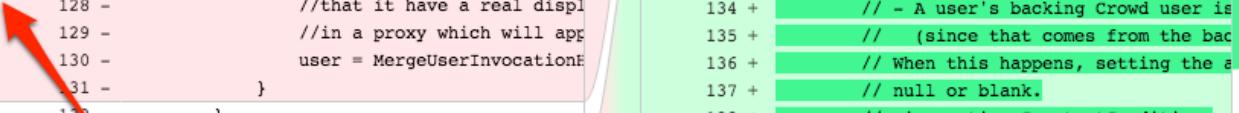

115      * could not be updated.
116      *
117      * @param pullRequest the pull request
118      * @return the chosen author
119      */
120 -     private StashUser chooseAuthor(PullReq
121         //First preference: The current co
122         StashUser user = authenticationCont
123         if (!isValidMergeAuthor(user)) {
124             //Second preference: The pull r
125             user = pullRequest.getAuthor();
126 -             if (!isValidMergeAuthor(user))
127 -                 //There are no valid users
128 -                 //that it have a real displ
129 -                 //in a proxy which will app
130 -                 user = MergeUserInvocationE
131 -             }
132         }
133
134 -         return user;
135     }
136
137     private <T> T withLock(PullRequest pull
138         Timer timer = TimerUtils.start("git

```

137 +         // null or blank.
138 +         //noinspection ConstantConditions

```

Bryan Turner

I think rather than doing all of this you could probably kill off `MergeUserInvocationHandler` and

Access keys

We've extended how you can use SSH keys to secure Git operations for Stash repositories.

Firstly, system SSH access keys, which allow you to secure the Git operations performed by other systems on Stash repositories, can now be either *Read-only* or *Read / Write*. Now you can use operations like `git push` or `git merge` if you want the other system to merge successful feature branch builds to the default branch in the Stash repository, or so that deployments can be tagged.

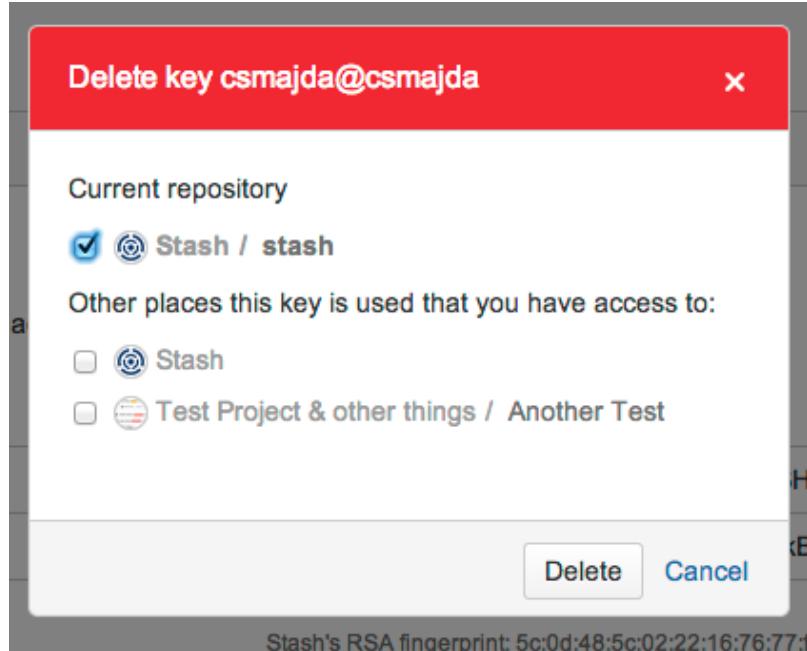

Add public key

Permission Read Read / Write

Key

```
ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAQEAiQ2h1S5FTGEBQpW0ww03x9lqzLMygEctMvw1iqchn34MbWx0WWEuA0dJ5kTldPPDmJf8vSrsFxGchaZI+7gdGhkG1B2xOJZDR6gBqkLVv7LB1lE0YzG1ctIrghE9Z68q7zUghvvia/F0VQLYZ:atmlPCt/PrOS164FB1kTThRcl97dtQnyQ==
```

Furthermore, we've provided greater visibility into where access keys are being used in Stash. When you want to delete a key, you now see a list of the other places where the key is being used, and can delete the key from those places as well:

The keys displayed in the list depend on your permissions to see those projects and repositories.

Read more about [SSH access keys for system use...](#)

DIY Backup

We've added to the backup and restore strategies available for use with Stash.

The new Stash DIY Backup is an alternative to the [Stash Backup Client](#), and provides a REST API that allows you to:

- significantly reduce the downtime needed to create a consistent backup,
- use the appropriate industry-standard tools to back up your Stash file system and external database back end,
- automate the Stash back up process.

As an indication of the downtime that can be expected when using Stash DIY Backup, in our testing and internal use we have seen Stash downtimes of 7–8 minutes with repositories totalling 6 GB in size when using the Backup Client, compared with downtimes of less than a minute when using the new DIY Backup with the same repositories.

```
$ ./stash.diy-backup.sh

```

Read more about a fully worked solution in [Using Stash DIY Backup...](#)

Small improvements

[Toggle comment display](#)

Use the Shift-C keyboard shortcut or the diff options menu to toggle comment display, either in a unified diff or a side-by-side diff. The icon in the left margin shows that comments are hidden:

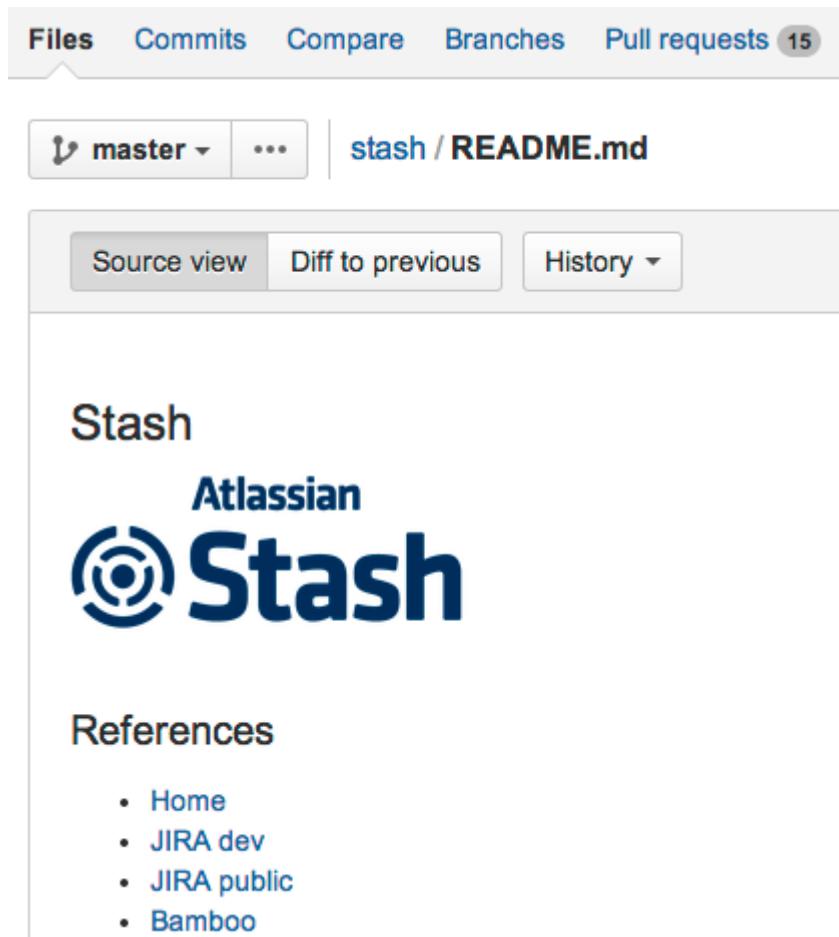

```

6      $('.aui-page-header').show().append($(el).show());
7  });
8
9 +     // Add aui class to all content tables
10    $content.find('table').addClass('aui');
11

```

[Markdown rendering in source view](#)

Markdown files are now rendered in the source view. The output handles images, links (including relative links) and table syntax.

Stash 2.11 release notes

25 February 2014

Introducing Stash 2.11

Today we're excited to announce Stash 2.11, which brings added support for code review workflows with side-by-side diffs and new ways to discuss code changes.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Please also check the [End of support announcements for Stash](#).

The Stash 2.11 changelog is at the bottom of this page.

Try it for FREE ➔

Commit comments

Now you can get immediate feedback on changes in a particular commit, even if they're not part of a pull request. Commit discussions allow you to request feedback early on in the development cycle – not only to ensure you are on the right path, but also to speed up subsequent pull requests because the bulk of the changes have already been reviewed. Commit comments also let developers point out general issues in code or discuss ideas for improving code quality in future work.

You can comment directly on a line of code right in the diff, just as you've been able to do with diffs in pull requests. Just hover over the line of code, click the icon at the left (arrowed below), and enter your comment; @mention another Stash user in the comment, to get their attention.

The screenshot shows a commit diff for the file 'pom.xml'. At the top, there are participant and unwatch options. A red arrow points to the '+' icon in the line 4 column of the diff table, indicating where a comment was added. A modal window titled 'Adding a comment about this particular line in this commit diff...' is open, containing a text input field and a tip: 'Tip: ⌘ + Enter to post your comment'. The diff table shows several lines of XML code with some changes highlighted in red and green. Line 8 shows a change from '<version>2.11.0-m3</version>' to '<version>2.11.0-SNAPSHOT</version>'. The bottom of the diff table has a 'Comment' button and a 'Cancel' button.

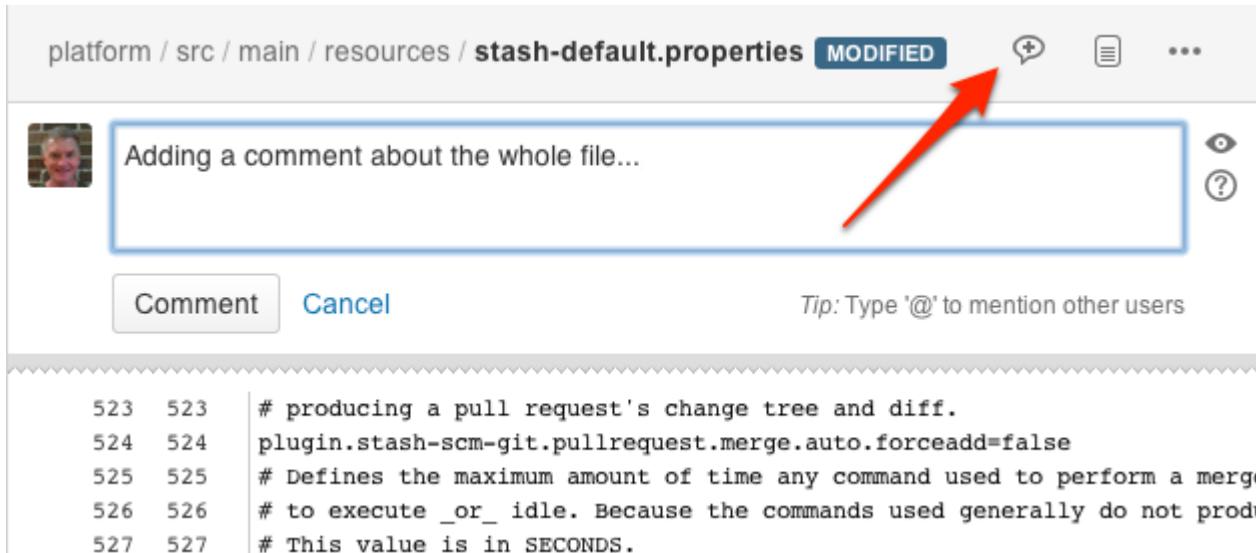

As the author of the commit, or when you make a comment, you're automatically made a watcher, and get notified when others comment. You can watch, or unwatch, the commit at any time, of course.

File comments for pull requests and commits

Until now you've only been able to comment on particular lines of code in files under discussion in pull requests. But what if you wanted to comment about the whole file, or about a file without text, such as an image? Now you can!

Whether you're looking at a pull request or a file in a commit, just click the header icon (arrowed below, or use the 'M' keyboard shortcut) to add a comment about the whole file. You can do this in both a unified diff or a side-by-side diff (also new in this release - see below).

As with general or in-line comments, file comments on a pull request appear in the activity stream, so it's easy for others to see, and you can @mention other Stash users to really get their attention.

platform / src / main / resources / **stash-default.properties** MODIFIED

527 527 # This value is in SECONDS.

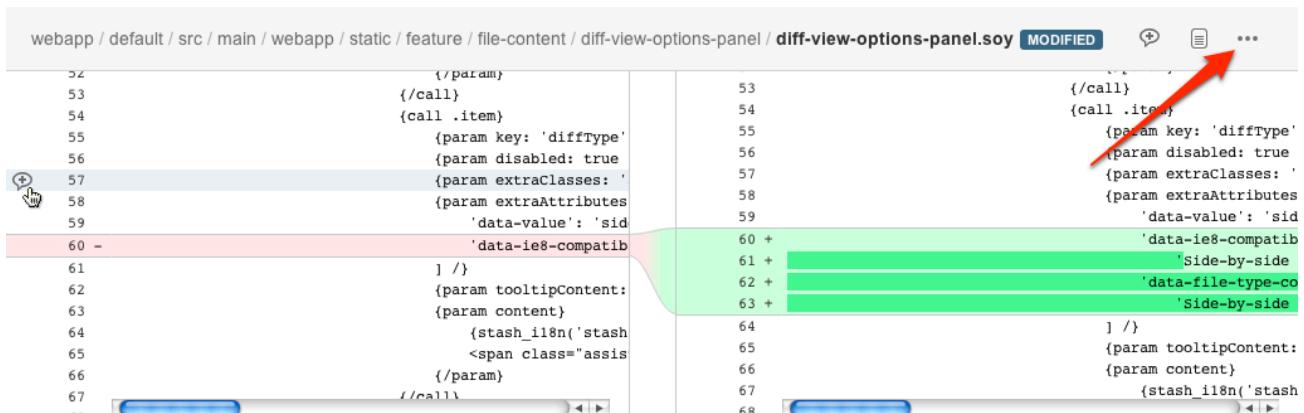

```

[Read more about pull requests in Stash...](#)

Side-by-side diffs

We added a new side-by-side view for when you're looking at diffs in both pull requests and commits – we think you'll find that this really improves your experience of using Stash for code reviews, and for viewing code changes in general.

Toggle between the unified diff and side-by-side diff views using the menu arrowed below. The side-by-side view is not available for added or removed files.

webapp / default / src / main / webapp / static / feature / file-content / diff-view-options-panel / **diff-view-options-panel. soy** MODIFIED

| | | | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 52 | 53 | 54 | 55 | 56 | 57 | 58 | 59 | 60 | 61 | 62 | 63 | 64 | 65 | 66 | 67 | 68 |
| | | | | | | | | - | | | | | | | | |
| | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | |

For a pull request, the lefthand panel shows the code in the target branch and the righthand panel shows what the result of merging will be. For a commit, the lefthand panel shows the previous revision and the righthand panel show the current revision.

As mentioned above, file comments and per-line comments are both available for the side-by-side view.

Small improvements

MySQL 5.6.16+ is now supported

Stash now supports versions of MySQL 5.6 from MySQL 5.6.16 on. See [Supported platforms](#).

Lockout recovery process

We've made some changes to help admins who accidentally lock themselves out of Stash. See [Lockout recovery process](#).

Change log

This section will contain information about the Stash 2.11 minor releases as they become available. These

releases will be free to all customers with active Stash software maintenance.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are the highlights of all those that have been resolved for the Stash 2.11.x releases. Note that Stash 2.11.0 and 2.11.1 were internal releases.

4 Aug 2014 - Stash 2.11.9

Stash 2.10 release notes

17 December 2013

Introducing Stash 2.10

Today we're pleased to announce Stash 2.10, which brings a wide range of small improvements. We've also added considerable polish to the Stash experience – these changes are listed in the 2.10.0 changelog [at the bottom of this page](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Please also check the [End of support announcements for Stash](#).

Try it for FREE ➔

Small improvements

We've made the following notable improvements:

- There is now a [Branch Utils REST API](#) that provides REST resources for managing branches in Stash repositories.
- The SSH clone URL is now shown for admins, when a project or repository access key is available.
- The permission screens for projects and repositories have been tidied.
- The URL now updates correctly when you switch revisions via the file history when viewing the 'Diff to previous' tab.
- Stash has been updated to use [AUI 5.3](#).

Change log

This section will contain information about the Stash 2.10 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are the highlights of all those that have been resolved for the Stash 2.10 releases.

22 May 2014 – Stash 2.10.5

| T | Key | Summary |
|-------------------------------------|------------|--|
| <input checked="" type="checkbox"/> | STASH-4696 | Memory leak when using a persistent SSH connections |
| <input checked="" type="checkbox"/> | STASH-4640 | page.max.directory.children does not show correct number of files on page load |
| <input checked="" type="checkbox"/> | STASH-4217 | SSH idle timeout is too large resulting in OutOfMemoryError when clients fail to terminate the session |

Stash 2.9 release notes

19 November 2013

Introducing Stash 2.9

Today we're excited to announce Stash 2.9, which makes managing your branches, pull requests and access to repositories much easier.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Please also check the [End of support announcements for Stash](#).

The Stash 2.9 changelog is at the bottom of this page.

[Try it for FREE ➔](#)

Branch listing improvements

We've made the branches listing a much more useful overview of the state of your repository:

- The new **Pull requests** status helps you to track the review and merge work that still needs to be done.
- The **Behind/Ahead** column helps you identify work in progress as well as stale branches, and now you can choose the base branch for the comparison.
- The new search makes it easy to find branches when you have a ton of them. Even better, if you're using the Stash [branch model](#), you can filter by branch type simply by searching for the prefix – for example, search for "feature/" to see all your feature branches.
- As before, the **Builds** column allows you to see the build status of branches at a glance.
- The **Actions** menus have altered tasks, such as creating a pull request, and checking out the branch in [Atlassian SourceTree](#).
- There are new navigation shortcuts – see them in **Keyboard shortcuts** under the Stash Help menu.

| Branch | Behind/Ahead | Updated | Pull requests | Builds | Actions |
|--|--------------|--------------|--------------------------|-------------------|---------|
| bugfix/STASHDEV-2623-branch-perms-max-pattern-validation | 3 | 6 mins ago | OPEN | | ... |
| STASHDEV-5560-ssh-urls-access-keys | 8 1 | 5 hours ago | OPEN | ✓ | ... |
| master DEFAULT BRANCH | | 10 hours ago | DECLINED | ! | ... |
| lower-case-slugs | 60 1 | 4 days ago | ! | | ... |
| release/2.8 | 323 | 4 days ago | MERGED | ✓ | ... |
| release/2.7 | 359 | 4 days ago | MERGED | ✓ | ... |
| release/2.6 | 385 | 4 days ago | MERGED | ✓ | ... |

[Read more about the branches listing...](#)

SSH access keys for projects and repositories

Stash now provides a simple way for other systems to perform read-only Git operations on repositories managed in Stash. This allows systems such as your build server to authenticate with Stash to checkout and test source code, without having to store user credentials on another system, and without requiring a specific user account.

These new access keys complement the personal account keys that have been available since Stash 1.1 – but they work for repositories rather than user accounts.

The screenshot shows the 'Access keys' section of the Stash Settings page. On the left sidebar, 'Access keys' is selected. The main area displays a table of access keys with columns 'Label' and 'Key'. Two entries are listed: 'mobileapp@team-game.com' and 'twitterapp@ridinghigh.com'. Below the table is a note about Stash's RSA fingerprint.

| Label | Key |
|---------------------------|--|
| mobileapp@team-game.com | ssh-rsa AAAAB3NzaC1yc2EAAAIBwAAQEA04Mhb5KFkuHbZYvZFNvpi0yum8O1D... |
| twitterapp@ridinghigh.com | ssh-rsa AAAAB3NzaC1yc2EAAAIBwAAQEA6CYOy4zGRuXf3wHsglTnoVJLWYFxq... |

Stash's RSA fingerprint: 5c:0d:48:5c:02:22:16:76:f6:3b:ab:0f:95:5a:05

[Read more about access keys ...](#)

Pull request inbox

Our pull request inbox has always provided easy access to the pull requests that need your review. In Stash 2.9, we've improved the inbox so that it also shows your own open pull requests. Toggle between these two sets directly from your inbox, and keep track of all your open pull requests seamlessly.

The screenshot shows the 'My pull requests' inbox. It includes a search bar, a feedback link, and user profile icons. The inbox lists one pull request from 'stash' titled 'Bugfix/testing merges' created by Vivien Leong.

| Repository | Title | Author | Reviewers |
|------------|-----------------------|--------------|-----------|
| stash | Bugfix/testing merges | Vivien Leong | |

[Read more about pull requests in Stash...](#)

Small improvements

Build status during branch creation

When you're creating a new branch, Stash displays the current build status for the source branch – is the branch good enough to branch from? [Read more about build status ...](#)

The screenshot shows the 'Create branch' dialog. It includes fields for 'Repository' (set to 'Stash / stash'), 'Branch type' (set to 'Bugfix'), 'Branch from' (set to 'feature/STASHDEV-3033-u...', with a red arrow pointing to the warning icon), and 'Branch name' (set to 'bugfix/').

Support for PostgreSQL 9.3

See [Supported platforms](#).

Extra keyboard shortcuts

We've added new keyboard shortcuts to help you navigate around the branch listing screen quickly – choose **Keyboard shortcuts** from the Stash Help menu to see these. Read more about the [branch listing screen](#).

Extra merge strategy option

We've added the `squash-ff-only` option. As with `squash`, it collapses all the incoming commits into a single commit directly to the target branch, never creating a merge, but it does so *only* if the source branch is fast-forward. If not, a `MergeException` will be thrown. See [Stash config properties](#).

Support for changing usernames

You can [change the username](#) for a user account that is hosted in Stash's internal user directory. If a user is renamed in your LDAP directory, Stash will pick that up in the next synchronisation, or when the user next logs in. All content and attributes associated with the original username will be automatically associated with the new username, including pull requests, comments and permissions. See the [Crowd 2.7 release notes](#).

Change log

This section will contain information about the Stash 2.9 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Stash 2.8 release notes

1 October 2013

Introducing Stash 2.8 – Git branch workflows

Today we're excited to announce Stash 2.8, which makes it easy for your team to use a branching workflow for your Git development process.

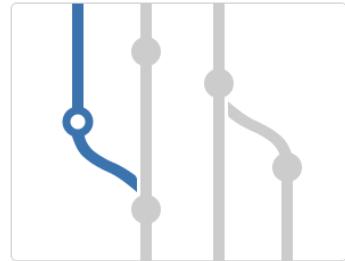

If you are upgrading from an earlier version of Stash, please read the [Stash](#)

upgrade guide.

Please also check the [End of support announcements for Stash](#).

The Stash 2.8 changelog is [at the bottom](#) of this page.

[Try it for FREE ➔](#)

Stash branching model

Stash 2.8 introduces a 'branching model' that provides key advantages for streamlining your Git development workflow:

- Developers can make consistent naming decisions when [creating branches in Stash](#), guided by the naming conventions specified in the branching model.
- Reduce the need for manual maintenance of release branches, because consistent branch naming allows Stash to [automatically cascade merges](#) to those branch types.

Branching model

| |
|--|
| Development *
<input style="border: 1px solid #ccc; padding: 2px 10px; width: 150px; height: 20px;" type="button" value="Use default branch"/>
<small>The integration branch used for development. Feature branches are merged back into this branch</small> |
| Production
<input style="border: 1px solid #ccc; padding: 2px 10px; width: 150px; height: 20px;" type="button" value="Select branch"/>
<small>The branch used for deploying releases. Typically, this branches from the development branch and changes are merged back into the development branch</small> |

Branch prefixes

Use the prefixes below as part of your branch names to categorize them and take advantage of automatic branching workflows. [Learn more](#)

| | | |
|---------|---|--|
| Bugfix | <input type="text" value="bugfix/"/> <input checked="" type="checkbox"/> | Typically used for fixing bugs against a release branch |
| Feature | <input type="text" value="feature/"/> <input checked="" type="checkbox"/> | Used for specific feature work. Typically, this branches from and merges back into the development branch |
| Hotfix | <input type="text" value="hotfix/"/> <input checked="" type="checkbox"/> | Typically used to quickly fix the production branch |
| Release | <input type="text" value="release/"/> <input checked="" type="checkbox"/> | Used for release tasks and long-term maintenance. Typically, this branches from the development branch and changes are merged back into the development branch |

Read more about the new [branching model](#) in Stash.

Branch creation from within Stash

You can now create new branches in your Git repositories directly from the Stash web UI. When a branching model is configured, Stash guides you into making consistent choices for branch names:

Create branch

Repository Paul Watson / stash

Branch type **Bugfix**

Learn about branch types

Branch from STASH-2867-context-lines

Branch name bugfix/ STASH-2887-context-lines

Create branch Cancel

Read more about [creating branches in Stash](#).

Branch creation from within JIRA and JIRA Agile

As part of our push to provide tighter integration between Stash and JIRA, you can now start creating a branch from within a JIRA issue, whether you are in JIRA or JIRA Agile. This gives you a faster workflow from picking an issue to starting coding:

Dates

Created: 2 hours ago
Updated: an hour ago

Development

[Create Branch](#)

Agile

[View on Board](#)

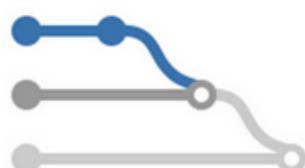

Stash will suggest the branch type and branch name, based on the JIRA issue type and summary – you can change these, of course.

Your Admin needs to have set up linking with JIRA before you'll see this. Read more about creating branches from JIRA.

Automated merges

When a branching model is configured in Stash that defines a 'release' branch for a repository, Stash can automatically merge changes to newer release branches. Cascading merges can reduce the manual maintenance for branches of that type.

Automated merging must be enabled for each repository, and is subject to a number of conditions. Stash applies an ordering algorithm, based on

patterns in the branch names, to determine the 'newer' branches.

Read more about [automatic branch merging](#) in Stash.

Branch listing pages

To complement branch workflows, Stash now provides an overview of all branches in a repository. The **Behind/Ahead** information shows by how many commits a branch has diverged from the default branch (for example, `master`) for the repository, and can help you to identify work in progress as well as stale branches. The **Actions** menus provide branch tasks such as viewing the branches source files, creating a pull request, creating a new branch, and checking out the branch in [Atlassian SourceTree](#).

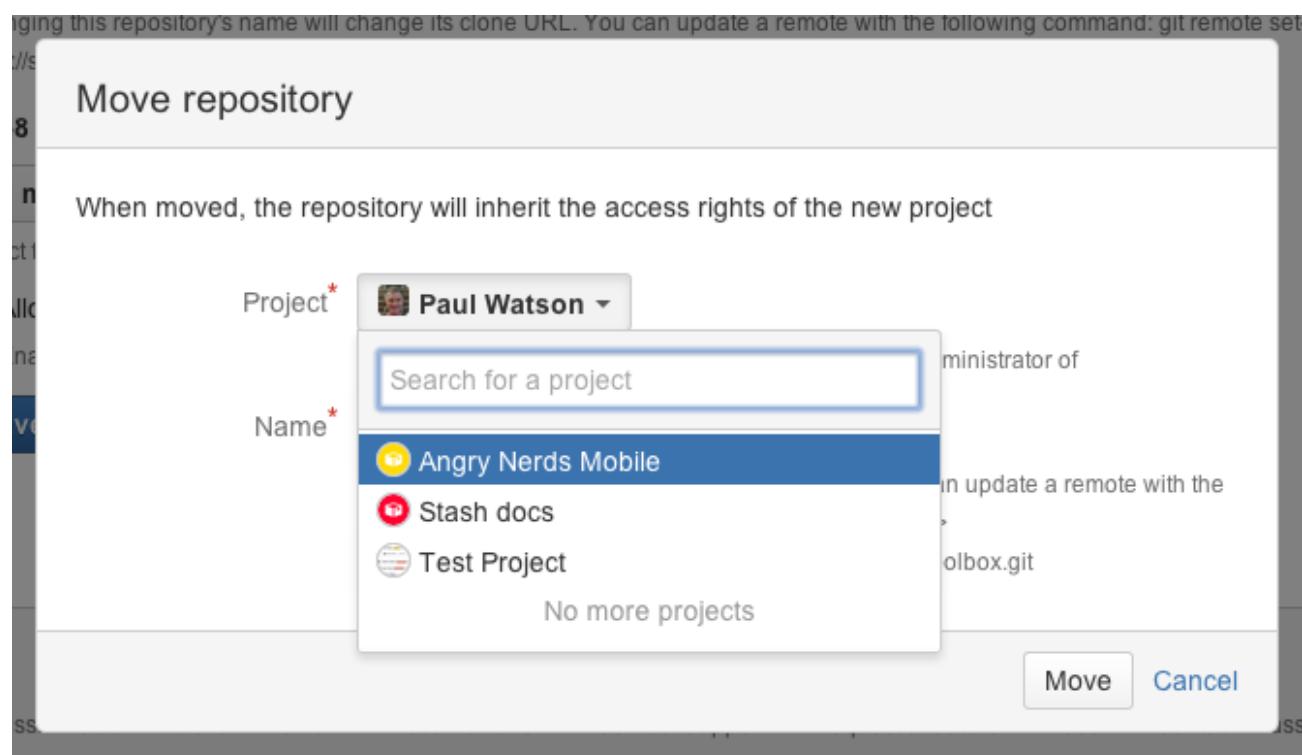

| Branch | Behind/Ahead | Updated | Builds | Actions |
|--|--------------|--------------|--------|---------|
| master DEFAULT BRANCH | | 2 hours ago | ! | ... |
| release/2.8 | 103 0 | 16 hours ago | ! | ... |
| feature/STASHDEV-4934-merge-dialog-pluggable-cancel-m... | 114 2 | 17 hours ago | ✓ | ... |
| feature/devsummary-sokefull | 923 16 | 18 hours ago | ✓ | ... |
| STASHDEV-4612-rest-coverage | 16 6 | 18 hours ago | | ... |

Read more about the [branches listing](#) for a repository in Stash.

Move Git repositories between Stash projects

You can now move a repository from one Stash project to another, if you have [project administrator](#) permissions for both projects.

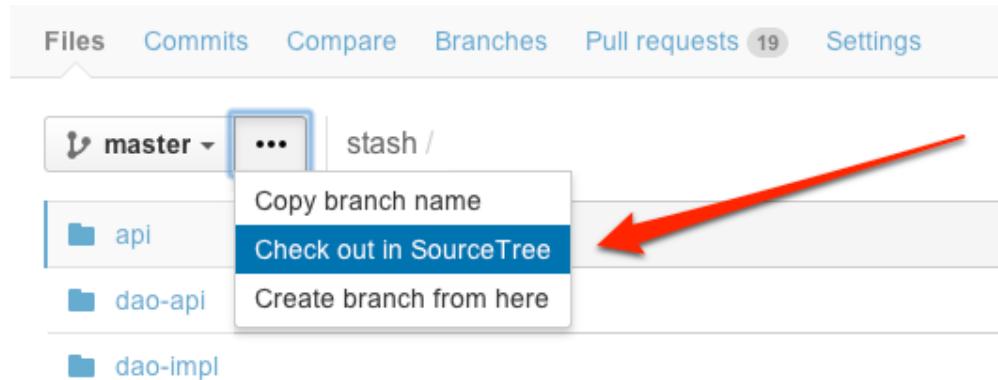

To move a repository, go to **Settings > Repository details** for the repository you wish to move, and click **Move repository**:

Improved integration with Atlassian SourceTree

You've been able to clone a repository from Stash using [Atlassian SourceTree](#) for a while. Now there are more ways that you can use Stash and SourceTree together, to help you use Git faster and more easily. Choose **Check out in SourceTree** from the Actions menu when you are:

- Viewing files or commits in a repository:

- Viewing branches in a repository:

| Updated | Builds | Actions |
|-------------|--------|---------|
| 10 mins ago | ... | ... |
| 43 mins ago | ✓ | ... |
| 49 mins ago | ✓ | ... |
| 49 mins ago | ✓ | ... |
| 1 hour ago | ✓ | ... |
| 2 hours ago | ✓ | ... |

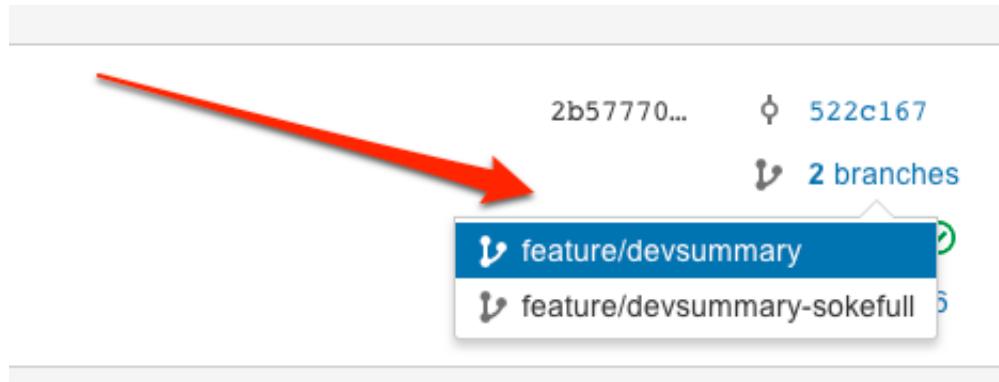

Small improvements

Stash backup client is now production-ready

The Stash backup client introduced with Stash 2.7.0 is now supported for use in production environments. See [Data recovery and backups](#).

See the branches that a commit is visible on

When browsing a commit you can now see all the branches that the current commit is visible on. This makes it easier to determine if a particular change has been merged to the master branch, for example, or not:

SSH support in the SCM Cache Plugin

The SCM Cache Plugin now supports SSH. This allows your CI build server to securely access the Stash server over SSH. See [Scaling Stash for Continuous Integration performance](#) for configuration information.

Auto-expand directories with only one sub-directory

In the files listing for a repository, Stash will now automatically expand a directory that contains only one sub-directory. This can save time where there is a series of nested single directories – Stash will continue expanding directories until it finds two or more sub-directories.

Change log

This section will contain information about the Stash 2.8 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are the highlights of all those that have been resolved for the Stash 2.8 releases.

10 March 2014 – Stash 2.8.5

| T | Key | Summary |
|-------------------------------------|------------|---|
| <input checked="" type="checkbox"/> | STASH-4452 | 500 errors on PR page due to markdown renderer |
| <input checked="" type="checkbox"/> | STASH-4075 | Pull Request Settings are visible and editable to non-admin users |

2 issues

11 November 2013 – Stash 2.8.4

| T | Key | Summary |

Stash 2.7 release notes

20 August 2013

Introducing Stash 2.7

Today we're pleased to announce Stash 2.7, which introduces a range of JIRA integration improvements, to help optimise your development workflows. We've also included a brand new Stash backup and restore solution.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

Please also check the [End of support announcements](#) for Stash.

The Stash 2.7 changelog is at the bottom of this page.

Try it for FREE →

JIRA issue transitions

Now you can easily [transition](#) a JIRA issue from within Stash. For example, when creating a pull request you may want to transition the issue into review. Click on a linked JIRA issue anywhere in Stash to see a dialog with the available workflow steps:

The screenshot shows a list of JIRA issues on the left and a detailed view of one issue on the right. The issue is titled 'Stash Dev / STASHDEV-4809 Release 2.7'. A red circle highlights the 'Code Review' button in the workflow dialog. The dialog also includes 'Reopen' and 'Close Issue' buttons. Below the dialog, the issue details are shown: Type: Development Task, Status: In Progress, Priority: Minor, Assignee: Jason Hinch [Atlassian]. The description field contains a link to a checklist: <https://extranet.atlassian.com/display/STASH/Stash+2.7+Release+Checklist>.

Your Admin needs to have set up linking with JIRA before you'll see this. Read more about [JIRA integration](#) in Stash.

Autolink JIRA issues in markdown

When you mention JIRA a issue key in Stash, for example in a pull request description or comment, the key gets automatically linked:

The screenshot shows a pull request details page. At the top, there are tabs for 'Overview', 'Diff', and 'Commits'. Below the tabs, the word 'Details' is highlighted. A red arrow points from the text 'Note that issue keys in a URL will link directly to the JIRA instance, as you'd expect.' down to the 'STASHDEV-2057' issue key in the text. The text reads:
Pierre-Etienne Poirot created a pull request 6 days ago
A project from a earlier innovation week, updated to leverage Michael Heemskerk's permissions improvements in 2.7 (STASHDEV-2057).
This will be merged after 2.7 is out, but the PR is opened to get early feedback.

You can click on the linked key to see details for the issue. Note that issue keys in a URL will link directly to the JIRA instance, as you'd expect. Read more about [JIRA integration](#) in Stash.

Support for multiple JIRA instances

Stash can now link to more than one JIRA server at a time, so different teams can work with their own projects in different JIRA instances, or a single team can link to issues across multiple JIRA servers.

Read more about [JIRA integration](#) in Stash.

Backup and restore beta

With the Stash 2.7 release we have made available a *beta* release of a backup and restore client for Stash. The Stash backup client locks access to Stash, checks that all Git and database operations have completed, and then performs a concurrent backup of the Stash database, repositories and data. You can download the Stash backup and restore client from the [Atlassian Marketplace](#).

The screenshot shows a 'Performing Backup' dialog. It contains the following text:
Backup is currently underway and shouldn't take long.
Backing up Stash data
Cancel backup

Although we are confident about the performance of this tool, we are interested in hearing how well it meets your requirements in actual use – this is why we are releasing the client as a beta. We look forward to your feedback!

Read more about [backing up and restoring](#) your Stash data.

[Send feedback »](#)

Small improvements

Improved LDAP synchronisation performance

We have greatly improved the performance for LDAP synchronisation. For example, on a test LDAP server with 10,000 users and 10,000 groups, the time for a full synchronisation improved from 64 minutes to 4 minutes.

The Repository System Information plugin is now deprecated

The functionality of the [repository system information plugin](#) has now been moved into core Stash. The plugin will still work for Stash 2.x versions but is redundant as of Stash 2.7.

Syntax highlighters are now configurable

You can now update the extensions associated with different syntax highlighters using the `stash-config.properties` file in the [Stash home directory](#). For more details see [Configuring syntax highlighting for file extensions](#).

MySQL default isolation level

Stash 2.7.x uses `READ_COMMITTED` instead of the MySQL default isolation level (`REPEATABLE_READ`). This can result in exceptions when installing/upgrading to 2.7.x, if [binary logging](#) is enabled in your MySQL server. More details and a fix can be found in this KB article.

Change log

This section will contain information about the Stash 2.7 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are just the highlights of all those that have been resolved for the Stash 2.7 release.

11 November 2013 – Stash 2.7.6

Stash 2.6 release notes

22 July 2013

Fork synchronization with Stash 2.6

Today we're pleased to announce Stash 2.6, which introduces automated fork synchronization and audit logging. We've also added a repository search and polished some existing features.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

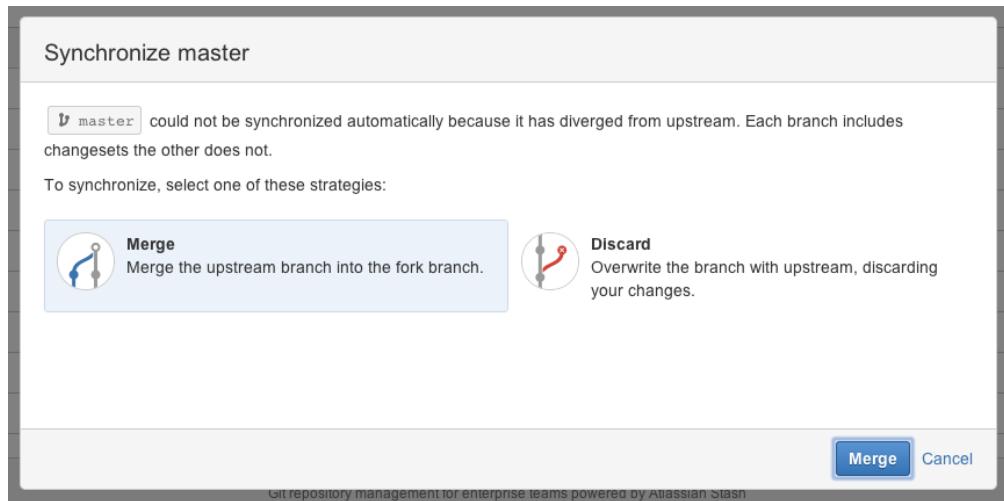

The Stash 2.6 changelog is at the bottom of this page.

Try it for FREE ➔

Fork synchronization

Fork syncing provides a way for your fork in Stash to be kept up-to-date with changes in the upstream repository, thus minimising the effort needed to do this manually. Stash can do this automatically, as long as you haven't modified the branches or tags in the fork.

If you have modified branches or tags in the fork, Stash will offer merge options:

Read more about using forks in Stash.

Audit logging

Stash now provides full audit logging. The most important audit events for each repository and project are displayed in Stash on the **Settings** tab (these are only visible to Stash admins and system admins):

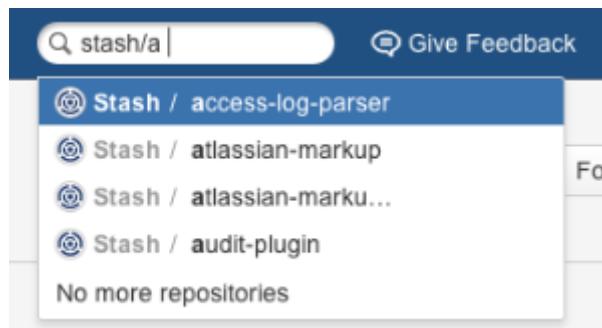

The screenshot shows the 'Audit log' section of the Stash interface. On the left, there's a sidebar with links like 'Repository details', 'Hooks', 'Pull requests', 'PERMISSIONS', 'Repository', 'Branch', 'ADD-ONS', 'Auto merge', 'Git operations', 'Branches and tags', and 'Audit log'. The main area has a header 'Audit log' with a 'Learn more' link. Below it is a table with columns 'User', 'Action', 'Details', and 'Time'. The table contains several rows of audit events, such as 'RestrictedRefRemovedEvent' by 'Charles O'Far...' and 'RepositoryHookDisabledEvent' by 'Michael McGl...'. The last event listed is 'RepositoryHookEnabledEvent' by 'Jens Schuma...', dated '26 Jun 2013'.

Stash also creates full audit log files that can be found in the <Stash home directory>/log/audit directory. The level of logging can be configured via system properties. Note that we recommend an automated backup of log files.

Read more about [audit logging](#) in Stash. Plugin developers can specify that their plugin events should be added to the 'Audit log' view, and the full audit log file.

Repository Quicksearch

Quicksearch makes it easy to jump to a particular repository, without needing to know the name of the project it's in. Start typing to see a list of suggested repositories. If you type a '/', text before that is matched against project names, and text after is matched against repository names. Note that wildcards and antglobs are *not* supported.

Small improvements

Application navigator

The new application navigator, on the left of the header, allows you to switch to your other applications, such as Atlassian JIRA and Bamboo – or any other web application – all from the Stash header:

The screenshot shows the Stash application navigator. It features a blue header bar with the Stash logo and navigation links for 'Projects' and 'Repositories'. To the left is a sidebar with a three-line menu icon. The sidebar contains a dropdown menu with options: 'Atlassian JIRA', 'Stash Prod', '• Stash Dev', 'Bamboo', and 'Configure...'. The 'Atlassian JIRA' option is currently selected, highlighted in blue. To the right of the sidebar, there's a search input field containing 'project' and a 'Key' field containing 'AN'. At the bottom, there's a logo for 'Angry Nerds'.

Stash administrators can configure which apps appear in the navigator – just click **Configure** in the application navigator, or go to the Stash admin area and click **Application navigator**. See [Configuring the application navigator](#).

List of public repositories

Stash now displays a list of repositories for which anonymous access has been enabled – anonymous and logged-in users can choose **Repositories > View all public repositories**. See [Allowing public access to code](#).

Deprecation of Java 6

In version 3.0, Stash will no longer support Java 6.0, and will only support Java 7.0 and above. Stash 3.0 is expected to be released later in 2013. See [Supported platforms](#).

Deprecation of Internet Explorer 8

In version 3.0, Stash will no longer support Internet Explorer 8, and will only support Internet Explorer 9 and above. Stash 3.0 is expected to be released later in 2013. See [Supported platforms](#).

Change log

This section will contain information about the Stash 2.6 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are just the highlights of all those that have been resolved for the Stash 2.6.x releases.

11 November 2013 - Stash 2.6.5 (1 issues)

Stash 2.5 release notes

12 June 2013

Go public with Stash 2.5

Today we're pleased to announce Stash 2.5, which fosters external participation and lets you enjoy even more streamlined code collaboration with public access to projects and repositories.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The Stash 2.5 changelog is [at the bottom](#) of this page.

[Try it for FREE →](#)

Public access to projects and repositories

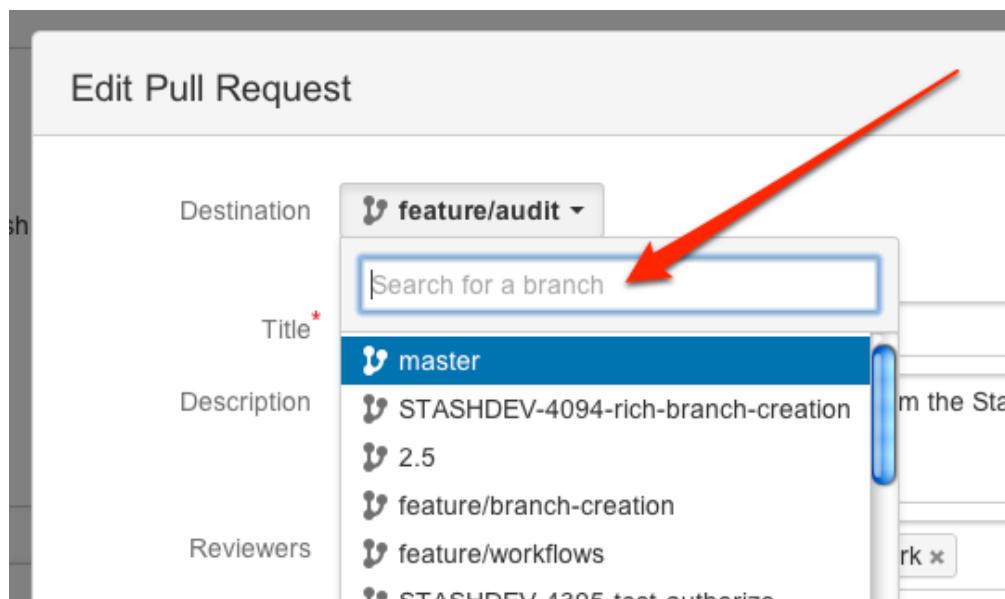

Public access provides anonymous (unauthenticated) users with *browse* access to specific repositories or entire projects in Stash. Anonymous users can see the source code in a repository, and clone the repository. Logged-in users get *read* access to a repository that has public access, so they can fork it and create pull requests. Public access doesn't allow your source code to be changed in any way.

You can configure public access to repositories and projects separately. You can also disable anonymous access by setting a global [system property](#). Please refer to the [Stash API changelog](#) for information about how plugin design is affected by public access.

[Read more about public access in Stash.](#)

Edit a pull request's destination branch

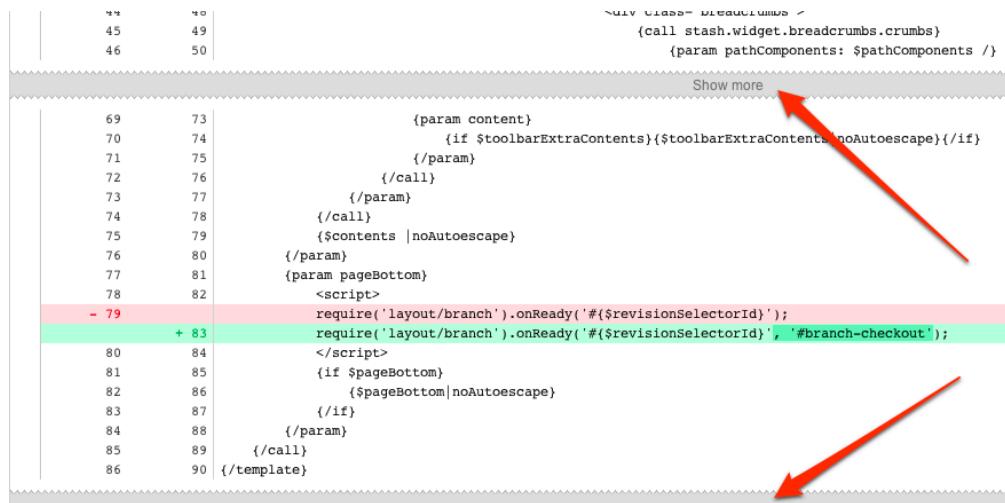

You can now change the destination branch for an active pull request – if you set the wrong destination when creating the PR, you no longer have to delete it and create a new one.

[Read more about pull requests in Stash.](#)

Get more context in diffs

We've added a way for you to see more lines of code in the diffs for pull requests and commits. We think this will really help with using pull requests for code reviews. Just click on the grey bars to see more context, up to the whole file if you want. There may also be grey bars at the top or bottom of the diff, if more context is available there.

A screenshot of a code diff interface, likely from a Git repository. The interface shows two columns of code with line numbers. A red arrow points from the 'Show more' button at the top right towards the bottom right of the code area. Another red arrow points from the bottom right towards the bottom left of the code area.

Java OpenJDK is now supported

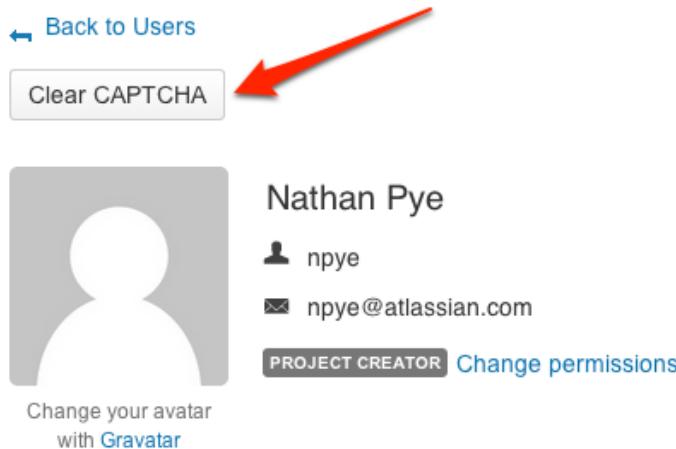

Java OpenJDK is widely used by Linux distributions. We've made your life easier by adding OpenJDK to the list of Java JDKs supported by Stash.

Just a reminder, Java 6 has been deprecated and will not be supported by Stash 3.0 (and later versions), which will be released later in 2013.

See [Supported platforms](#) for more information.

Small improvements

- JIRA issues that only appear in forks are now linked to the JIRA server.
- Stash now respects `.mailmap` files in Git repositories. See [Git resources](#) for details.
- The SCM Cache plugin is now bundled - see [Scaling Stash for Continuous Integration performance](#).
- We've added a bit more control for CAPTCHA:
 - There is now a [system property](#) switch to turn off (and hide) the **Maximum login attempts** control (look under 'Authentication' in the admin area).
 - Administrators are now able to clear a user's CAPTCHA status, from the user's profile:

A screenshot of a user profile page. At the top left, there is a 'Back to Users' link. Below it is a 'Clear CAPTCHA' button, which is highlighted with a red arrow. The main content area shows a placeholder Gravatar icon, the user's name 'Nathan Pye', and their contact information: 'npye' and 'npye@atlassian.com'. There are also 'PROJECT CREATOR' and 'Change permissions' buttons. At the bottom, there is a link to change the user's avatar with Gravatar.

Change log

This section will contain information about the Stash 2.5 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

Stash 2.4 release notes

6 May 2013

Introducing Stash 2.4 – Forking in the Enterprise

Today we're pleased to announce Stash 2.4, which introduces several key features to help you manage and collaborate on your Git repositories behind the firewall – forking, a workflow popularized in open source development, along with personal repositories and per-repository permissions.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The Stash 2.4 changelog is at the [bottom](#) of this page.

[Try it for FREE ➔](#)

Forks

Forks in Stash provide developers with a way to contribute code back to a repository for which they do not have write access. This extra control and flexibility of your development process lets you choose workflow scenarios that fit best. You can allow contractors to contribute to a project, or give developers the freedom to spike a project or prototype a feature, without risk to your core repositories.

Stash allows developers to fork a repository into any other project in Stash for which they have admin access. They can also create [personal forks](#) and then give others access by applying repository permissions.

Read more about using [forks](#) in Stash.

Repository permissions

We've added repository permissions to Stash, which along with the already existing project and branch-level permissions, give you flexible yet fine-grained control over access to your repositories.

Repository permissions

Repository permissions allow you to extend access to users and groups beyond that already granted via [project permissions](#).

Individual Users

| Name | Admin | Write | Read |
|--------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| Add Users | | | <input checked="" type="checkbox"/> |
| Charles O'Farrell | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| Giancarlo Lionetti | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Jens Schumacher | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Matthew Watson | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Paul Watson | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Stefan Saasen | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| Thomas Bright | <input type="checkbox"/> | <input type="checkbox"/> | <input checked="" type="checkbox"/> |

Groups

| Name | Admin | Write | Read |
|-------------------|-------------------------------------|-------------------------------------|-------------------------------------|
| Add Groups | | | <input checked="" type="checkbox"/> |
| atlassian-docs | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| atlassian-staff | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| stash-users | <input type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |
| sudoers-stash-dev | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |

Read more about [repository permissions](#) in Stash.

Personal repositories

You can now create personal repositories, unrelated to other projects, that you can use for such purposes as storing private snippets of work, kick-starting your own project, or contributing a bug-fix for a project that you are not a member of. By default, personal repositories are not visible to other Stash users. However, you can use [repository permissions](#) to open up access to other individuals and groups.

Your personal repositories are listed on the **Repositories** tab of your profile page. Every Stash user can see your profile page, but they can only see those repositories that you have given them permission to view.

The screenshot shows the Stash profile page for 'Giancarlo Lionetti'. At the top, there is a profile picture, the name 'Giancarlo Lionetti', and links for 'Create repository' and 'Manage account'. Below this, a 'Repositories' tab is selected, showing a list of five repositories:

| Name |
|------------------------------|
| access-log-parser |
| sourcetree-git-client-shipit |
| stash |
| stash-emoticons-plugin |
| svn-git-importer |

[Read more about personal repositories in Stash.](#)

Deprecation of Java 6

This is to give advance notice that Stash 3.0 will not support Java 6.0, and will only support Java 7.0 and above. Stash 3.0 is expected to be released later in 2013.

API changes

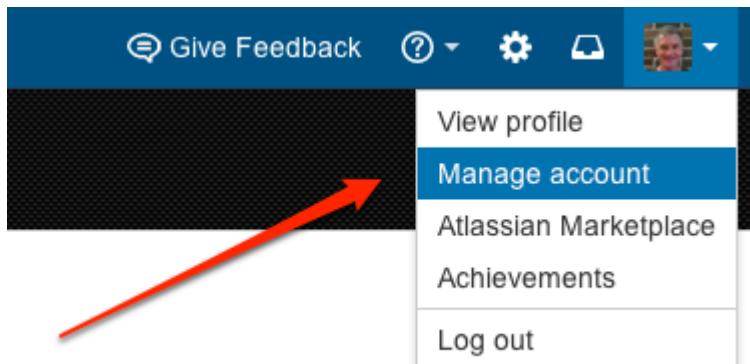

Please see the [API changelog](#) for any changes made for Stash 2.4.

Small improvements

Managing your Stash account

All the details of your Stash user account are now collected on your Stash account page. Use your account page to manage aspects of your Stash account, including changing your Stash password or avatar, and adding SSH keys.

To go to your account page simply choose **Manage account** from your user menu in the header:

Secret whitespace query parameter

Sometimes a diff is hard to read simply because multiple lines have only had the whitespace changed. To see just the important changes, use the `w=1` (`--ignore-all-space`) query parameter, which is the same as the `git diff` option. For example, the URL could look like:

https://stash-your_organisation.com/projects/STASH/repos/your_repo/commits/c573ea24e70c9d21ee?w=1#your_repo_path/DiffRequest.java

Before:

```

- 28
- 29
- 30
- 31
- 32
- 33
- 34
- 35
    }
And later in the diff...
+ 28
+ 29
+ 30
+ 31
+ 32
+ 33
+ 34
    }

```

After:

```

28      27
- 29
+ 28
    private DiffRequest(Repository repository, String sinceId, String untilId, List<String> paths, Whitespace whitespace) {
30      29
    this.repository = repository;
31      30
    this.sinceId = sinceId;
32      31
    this.untilId = untilId;
33      32
    this.paths = paths;
34      33
    this.whitespace = whitespace;
35      34
    }

```

Change log

This section will contain information about the Stash 2.4 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The issues listed below are just the highlights of all those that have been resolved for the Stash 2.4 release.

21 May 2013 - Stash 2.4.2 (11 issues)

| T | Key | Summary |
|------------------------------------|------------|---|
| ● | STASH-3475 | Upgrade bundled Tomcat due to security vulnerabilities |
| ● | STASH-3463 | Invalid "Authorization" headers for basic auth result in 500 errors |
| ● | STASH-3460 | During directory synchronization, commit errors trigger cascading rollback failures |
| ● | STASH-3458 | ResourceBundle ClassLoader lock contention under heavy load can soft-lock the system on Java 6 |
| ● | STASH-3452 | Cannot create pull request between same branch in different repos |
| ● | STASH-3448 | Database errors during setup and migration produce useless messages |
| ● | STASH-3447 | 2.4 RestStashUser not backwards compatible |
| ● | STASH-3433 | Files view shows an old version of README.md |
| ● | STASH-3427 | 500 error if the user session has expired when opening the merge dialog |
| ● | STASH-3393 | Forking Git commands fails silently on Solaris when there is not enough memory |
| ● | STASH-3096 | WARNING: Problem with directory [/home/stash/atlassian-stash-data/lib], exists: [false], isDirectory: [false], canRead: [false] |

Stash 2.3 release notes

26 March 2013

With today's release of Stash 2.3 we introduce features for enterprise teams (single sign-on), Git operations (submodule recognition and branch deletion) and CI performance scaling (the SCM Cache plugin).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The Stash 2.3 changelog is at the bottom of this page.

Try it for FREE ➔

Single sign-on with Crowd

Atlassian Crowd allows enterprise teams to integrate and deploy single sign-on (SSO) using popular directory servers such as Active Directory or OpenLDAP. Now your team members need only log in once to any of your Atlassian applications (JIRA, Confluence, Bamboo) to be able to access all of them, without repeatedly typing in their password.

- *IT administrators* can centralize user management through Crowd and provide SSO for all Atlassian apps with minimal configuration.
- *End-users* enjoy the convenience of logging in once to any Atlassian application, avoiding the interruption of repeated authentication across other applications. Log in once, and you're automatically logged in to all applications connected to Crowd, including Stash.

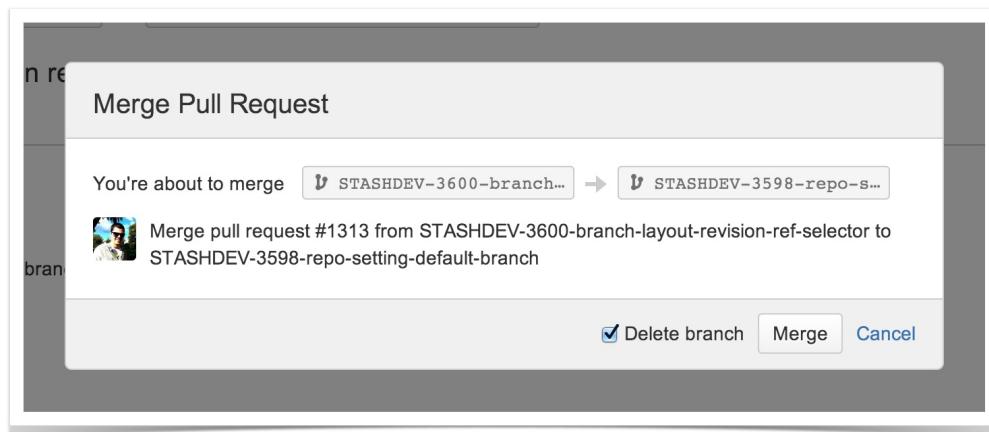

[Read more about using SSO with Stash.](#)

Branch cleanup

We know that branches are often used for feature work, or for hot fixes that are destined to be applied to a stable or development branch. Once the code has been integrated into its destination branch it may often be desirable to delete the branch from Git as it is no longer required in the repository.

Stash now provides a simple way to delete the branch when you merge the pull request. As you might expect, Stash checks on a few things before allowing the deletion – the branch being merged will not be deleted if:

- The branch is the default repository branch.
- The user does not have permission to delete the branch.
- The branch is subject to an open pull request.

[Read more about branch deletion when merging a pull request in Stash.](#)

Git submodule recognition

Git submodules allow you to nest external Git repositories within the directory structure of your own repository.

Submodules are commonly used to embed external codebases, such as shared libraries, that are updated independently of the main project.

Stash now makes it easy to identify Git submodules through the Stash user interface:

SCM Cache plugin for continuous integration performance

Stash instances with continuous integration (CI), or other automatic tooling set up to poll for changes, can end up with a high load on the Stash server due to frequent polling for changes, and bursts of repository clones when a change is detected.

The [Stash SCM Cache plugin](#) caches the pack files generated by Git during a clone operation on disk. This reduces the CPU load on your server and greatly improves response time when your server experiences repetitive requests from the continuous integration server.

Memory and CPU usage

Memory usage without SCM cache

Memory usage with SCM cache

CPU usage without SCM cache

CPU usage with SCM cache

Read more about installing and configuring the Stash SCM Cache plugin.

Change log

This section will contain information about the Stash 2.3 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

4 April 2013 - Stash 2.3.1 (4 issues)

| T | Key | Summary |
|---|------------|---|
| | STASH-3286 | Unnecessary WARN log message when an unlicensed user attempts to log in. |
| | STASH-3285 | Profile javascript errors for users with numeric usernames starting with zero |
| | STASH-3278 | LDAP synchronisation fails with NumberFormatException |
| | STASH-3264 | Crowd SSO integration is not enabled if Crowd has an empty SSO domain configuration |

Stash 2.2 release notes

05 March 2013

With today's release of [Stash 2.2](#) we introduce several capabilities for customising your Git development workflow – Git repository hooks, an API for hook integrations, and merge checks for pull requests.

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

The Stash 2.2 changelog is at the bottom.

Try it for FREE

Git repository hooks

Git hooks allow you to customise your development team's workflow for any requirement they may have. Admins can enable and configure hooks for each repository, right within Stash, without having to install them on the file-system.

Stash comes bundled with repository hooks to let you start customising Stash straight off.

Hooks [Add hook](#) [Learn more](#)

Hooks allow you to extend what Stash does every time the repository changes (for example, when new code is pushed or when a pull request is merged). Hooks are installed by the system administrator and can be enabled by project administrators on a per-repository basis.

Pre receive - reject commits that don't match your policies

 **Reject Force Push**
Reject all force pushes (git push --force) to this repository

[Disabled](#) [Enabled](#)

Post receive - perform actions after commits are processed

 **HipChat Push Notification** 
Sends a notice to the specified HipChat room whenever someone pushes to the repository.

[Disabled](#) [Enabled](#)

Read more about using [repository hooks](#) in Stash.

API for hook integrations

We've leveraged native Git hooks to create a new hooks API that allows developers to easily write their own hooks. Stash handles the persistence, packaging and per-repository configuration for your hooks, making it simple to extend Stash to suit your particular project's needs. Read more about [writing hooks for Stash](#) in our revamped developer docs.

Furthermore, you can mix-and-match bundled Stash hooks with hooks from the [Atlassian Marketplace](#). You can find and install these from within Stash – simply use the **Add hook** button on the hooks settings page to view available hooks from the marketplace.

Merge checks for pull requests

To help customise your workflow, you can now set checks to control when a pull request can be merged. Pull requests cannot be merged if the required checks have not been met. These checks are set separately on each repository in a Stash project:

- Require a minimum number of approvers – block merging of a pull request until it has been approved by the selected number of participants.
- Require a number of completed builds – stop pull requests from being merged if they have any unsuccessful builds, and until the set number of builds have completed.

Pull requests

Requires approvers
At a minimum, pull requests must be approved by the number of users above before it can be merged

Requires a minimum of successful builds
If there are more than the specified number of builds, all of them will have to be successful in order to merge the pull request

[Save](#) [Cancel](#)

Read more about [merge checks](#) in Stash.

Change log

This section will contain information about the Stash 2.2 minor releases as they become available. These releases will be free to all customers with [active Stash software maintenance](#).

If you are upgrading from an earlier version of Stash, please read the [Stash upgrade guide](#).

05 March 2013 - Stash 2.2.0 (10 issues)

Stash 2.1 release notes

5th February 2013

With today's release of [Stash 2.1](#), we've added a slew of new features to simplify your Git development workflow by providing more contextual awareness of key JIRA issue and Bamboo build information. Additional new features provide quick clicks to your recently viewed pull requests and notifications of your tasks. More contextual information, more tracking capabilities, more automation – that's Stash 2.1.

Try it for FREE 

Pull request integration with JIRA

Developers create pull requests when their code is ready for peer review before merging a development branch into the main code line. To make pull requests most effective, reviewers need more context around the changes: What bug or feature is this pull request resolving? What are the details of those issues? Are any of the issues still open?

Pull requests now tightly integrate with JIRA, putting issue details front and center. View the status of an issue, along with its assignee and description to get the scoop without ever leaving Stash. This allows reviewers to

- Gain contextual awareness into the task which is being worked on by looking at descriptions, comments and attachments
- Quickly review the requirements for a new feature or bugfix
- Click straight through into JIRA, to keep issues up to date for upcoming releases

The screenshot shows a Stash interface for a pull request. A callout box highlights a message: "Important details about JIRA issues related to a pull request are at a reviewer's fingertips." A circled area shows a summary of JIRA issues and builds.

JIRA Issues

| T | Key | Summary | Assignee | P | Status |

- STASHDEV-2931: Add REST documentation for the ConfiguredHookResource
- STASHDEV-2931: Minor cleanup

Activity

What do you want to say?

Jason Hinch UPDATED the pull request by adding 1 commit 14 hours ago

Read more about pull requests in Stash.

Build status API

Picture this: you're about to click the 'merge' button, and then you pause to consider: *did these changes pass all their tests?* To answer that, it's important to know what the latest build status of the branch is before the changes are integrated into master. But don't waste time navigating to your build system and sifting through test data to see whether the changes passed or failed. Stash 2.1 does it automatically. Our new build status API allows build servers, such as Bamboo and Jenkins, to publish build details to the pull request's overview, giving you a quick idea of whether the pull request is good to merge or not.

The screenshot shows a pull request overview with a focus on build status. A callout box highlights the 'Builds' section.

But why stop with pull requests? The build status API will show you the build status of any commit, anywhere in Stash.

Read more about the [build status API](#) in our developer documentation.

Project Avatars

Give your projects some personality and make it easier to find them on the Dashboard with the new project

avatars. Stash will randomly provide one of its colorful built-in avatars if you don't have one.

| Project | Key | Description |
|-------------------------|-----------|---------------------------------------|
| Angry Nerds | AN | Angry Nerds Project |
| Bamboo | BAM | No description |
| Blitz | BLTZ | For Blitz testing |
| Clover History | CLOV_HIST | Clover Coverage History |
| Confluence | CONF | Confluence Source |
| External Open Source | EXTOS | Project for holding external open sou |
| Performance Engineering | PERFENG | No description |
| QA Project | QA | Project with QA resources. |

Pull request inbox

When you work across multiple repositories and projects, it can be hard to keep track of all the reviews you have to complete. We solved the problem by providing a globally accessible inbox, displaying all Pull Requests that are waiting for your approval. Use the inbox as a task list, and leave no pull request behind!

| Repository | Title | Author | Reviewers |

| stash | STASHDEV-2931 Persisted settings which aja... | | |
| stash | STASHDEV-3061 comment tab ordering | | |
| stash | STASHDEV-3047 page settings | | |

Release log

A few handpicked tickets out of a list of more than 100 features and improvements.

| New Features & Improvements | |
|-----------------------------|--|
| | Pull requests show linked JIRA issue details |
| | Build status API |
| | Project avatars |
| | Track viewed files in a pull request |
| | Current branch is preserved when navigating between Files and Commits tab |

| | |
|--|---|
| | Improved pull request title & description generation |
| | Pull request inbox |
| | A user can see build status information in the pull request overview |
| | A user can see build status information in the commit details view |
| | A user can see build status information in the commit list |
| | Bundle the Scala runtime library and expose to Plugins |
| | Just in time comment drift calculation (less load on your server!) |
| | Add rich tooltips to disabled image diff toggles |
| | Add mention 'tip' to emails |
| | Added web sections for pull request metadata |
| | Stash now shows file mode changes (executable bit) in changesets and pull requests |
| | Add an "About" page |
| | Allow use of `@` when adding reviewers to a pull request |
| | Add default avatar to project create page |
| | Stash plugins can listen for user cleanup events |
| | Add endpoint to retrieve issue details for a pull request |
| | Improve error handling for reflog config upgrade task |
| | Allow for the hook callback address and port to be specified via a property |
| | Add [as a keyboard shortcut for toggling the diff tree |
| | Stash throttling: Improve experience for user pushing/pulling when number of concurrent git processes have been exceeded. |
| | Stash returns HTTP 500 and /mvc/error500 on git error during hosting operations |
| | Use \$STASH_HOME/lib for classpath library directory |
| | Cannot view a commit that has a vertical bar character username |
| | HTML returned from incorrect auth details for REST API request |
| | LifecycleAware component's onStart method is not called after plugin upgrade/enablement |
| | j and k keyboard shortcuts don't respect "Your unactioned pull requests" filter |
| | Thread local cache in ActiveObjects causes incorrect branch permissions to be evaluated |
| | service.bat does not call permgenservice.bat |
| | Comment tip <code>re:markdown</code> should link to help docs |
| | Hide "Add Users" from Stash dashboard and Group administration if internal directory is disabled |
| | Project key is appended to PR link in pull request list |
| | Cmd/Ctrl+Return doesn't submit comment when in preview |

Stash 2.1 changelog

This page will contain information about the Stash 2.1 minor releases as these become available. These releases will be free to all customers with active Stash software maintenance.

Stash 2.0 release notes

4th December 2012

Meet the Enterprise-ready Stash 2.0 – Powered by Git. Controlled by You.

Imagine all the flexibility of Git with the control needed in the Enterprise. That's Stash 2.0. It comes packed with a heap of features including the highly anticipated branch permissions, @mentions, markdown support and a number of great improvements to pull requests. Additionally Stash 2.0 has been tested in very large environments to ensure you nail the landing of Git in your enterprise.

Try it for FREE ➔

Branch permissions

Per-branch "write" permissions for individuals and groups ensure that stable branches remain stable, and development branches foster collaboration. It's a whole new level of Enterprise security.

Some development workflows require that specific developers oversee merges into the master or release branches, while other developers work on bug-fix and feature branches. Branch Permissions let you turn this "gentlemen's agreement" into a seamless, enforceable process, reducing confusion and time wasted backing out changes that were merged prematurely.

Read more about [branch permissions](#) in Stash.

| Branch permissions | | Add permission |
|----------------------------|-------------------------------|-------------------------------|
| Branch | Users | Groups |
| STASHDEV-2237-diff-scro... | Adam Ahmed
Jens Schumacher | No groups have been permitted |
| master | No users have been permitted | stash-admins |
| release/2.0 | Seb Ruiz | No groups have been permitted |

Advanced branch permissions

Advanced Branch Permissions allow you to specify a pattern that is matched against branches and tags being pushed to Stash. This allows you to restrict pushes to multiple branches without the overhead of configuring them individually. Establishing naming conventions based on roles or functional areas (ie, "contractor_" or "userauth_") makes it even easier to set and standardize permissions throughout your organization.

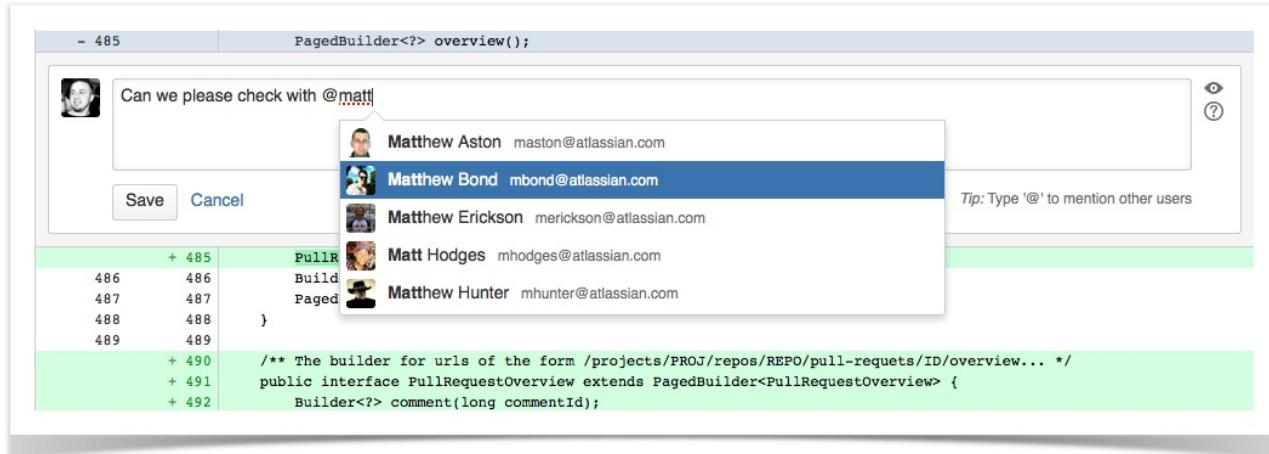

GateKeeper

Branch Permissions can act as a "GateKeeper", allowing you to select a person who is responsible for ensuring that all the code going into production has been properly tested and reviewed. The integration with Pull Requests ensures that only the GateKeepers can merge the changes into the branch you are protecting.

@Mentions

Now you can use 'mentions' to notify another Stash user about the pull request descriptions and comments you are writing. When you mention a user, Stash sends them an email notification, to help streamline communication between your team members.

You can use mentions when writing pull request comments – simply start typing '@' and then the users name, and choose from the list that Stash offers. You can use quotes for unusual names, for example if it has spaces.

Markdown support

Stash now gives you a boost with support for markdown in comments and descriptions. Bring your words to life and get your point across quickly.

- **Emphasize** parts of your [comment](#) or create lists to bring your points across.
- Share links to requirements and issues related to the feature you are implementing.
- Provide code examples, formatted just like in your IDE.
- Include screenshots into the discussion for any UI focused features.

Read more about [Markdown support](#) in Stash.

The screenshot shows a conversation in Stash. Seb Ruiz asks for assistance with a task, listing 'Test data' and 'Code improvements'. Giancarlo Lionetti replies with a test count update and a code snippet. Below the messages is a chart titled 'Number of tests (weekly averages over last 90 days)' showing a steady increase from approximately 2500 to 3200 tests. At the bottom, a timestamp indicates the message was edited 11 minutes ago.

Improved Pull Requests

Beyond @Mentions and Markdown support, Stash 2.0 features a huge number of improvements to Pull Requests.

Improved Diff view

The Diff view in Pull Requests has been engineered to maximise the available screen real-estate when reviewing a Pull Request. The file header and tree navigation now stalk to provide an almost full screen experience without having to switch into a special mode.

Faster page load times & keyboard shortcuts

The Pull Request tabs have been revamped to make them a whole lot faster to load and with the new keyboard shortcuts (1, 2, 3) it's also a whole lot faster to navigate between the tabs.

Comment indicators

With comment indicators on the filenames, it is now much easier to identify where the discussions are happening when in the Diff view.

New Comments are highlighted

New comments that have been added since your last visit are now highlighted in yellow, making it much easier to follow the conversation on the Pull Request overview.

Stash 1.3 release notes

9th October 2012

Meet the new, more social Stash – introducing Pull Requests

Pull requests provide your team with a quick and easy way to review code changes made on a branch, discuss those changes, and make further modifications before the branch is merged back to master or your main development branch.

Branch
Develop features on a branch and create a pull request to get changes reviewed.

Discuss
Discuss and approve code changes related to the pull request.

Merge
Merge the branch with the click of a button.

Try it for FREE ➔

Pull requests

With Stash and Pull Requests, code reviews become an integral part of your development process. Development happens on branches and when code is ready to be merged into the main branch a Pull Request is opened. Unless the code has been reviewed as part of a Pull Request, it does not get integrated back into the main branch. All the benefits of code review baked right into your workflow!

Creating a pull request is like starting a discussion. Your reviewers can see the changes you have made, comment on those changes and commit further changes and improvements to the branch if required. When everyone agrees, the branch can then be merged back to master or your main development branch.

Getting your code reviewed has never been easier – simply click the **Pull Request** button in the repository header, select the branch you've been working on, the branch you want to merge to, then add a short description and you're done.

Read more about using pull requests in Stash.

Discussions

The essential thing about a pull request is the discussion that takes place around the code changes you are making. The overview captures the entire activity of the pull request. Comments on the diff, replies, or new commits to the branch.

```

229   286
230   287
231     if (drifts == null) {
232       + 288     if (pendingDrifts == null) {
233         289       log.debug("{}: No rescopes are pending drift", pullRequest.getGlobalId());
234         290       return null;
235     }
236     292
237     - 293     CommentDriftCalculator calculator = calculatorFor(drifts);
238     + 293     UtilTimerStack.push("Drift: calculate for " + calculator);
239
240     final List<InternalDriftRequest> drifts = pendingDrifts;

```

Charles O'Farrell commented on a file 20 hours ago

Charles O'Farrell Do you need this second variable? Can you make pendingDrifts final?

Michael Heemskerk I can't because of the 'synchronized (pending)' block above.

Changed Files

Diffs for a Stash pull request highlight the changes that would result from the merge. The diff tree shows all modified files and, as you'd expect, you can click on any file to see exactly what has been added, deleted or modified. Threaded comments right in the diff allow meaningful and contextual conversations about your code.

Commits

A pull request is dynamic! Not only can there be a lively discussion about code changes, but participants can commit new changes to the branch. Stash auto-updates the **Commits** tab of the pull request, so you can see exactly which commits will be merged. Stash is smart about comments, moving them along when lines are added or removed. If a line with a comment gets removed, you can still view the comment in the activity, but Stash marks the diff as *outdated* to let you know that this piece of code has been changed in recent commits.

README – simple project documentation

Stash now provides an appealing, yet simple, way to document the project right in the repository by rendering the content of .md and .txt files in the file view of the repository. If the file uses [Markdown](#), that gets rendered straight to the screen.

README.md

Build

To build the logparser run

```
$> cabal configure  
$> cabal build
```

If any of the dependencies are missing run:

```
$> cabal install --only-dependencies
```

Tests

Enable tests

```
$> cabal configure --enable-tests  
$> cabal build  
$> cabal test
```

See the [change log](#) for Stash 1.3.x minor releases.

Stash 1.3 changelog

This page will contain information about the Stash 1.3 minor releases as these become available. These releases will be free to all customers with [active Stash software maintenance](#).

Don't have Stash 1.3 yet?

Take a look at all the features in the [Stash 1.3 release notes](#) and see what you are missing out on!

 [Download](#)

[Upgrading from a previous version of Stash](#)

If you are upgrading, please read the [Stash upgrade guide](#).

Stash 1.3.1

7 Nov 2012

This is a bug fix release. The issues addressed in this release of Stash are shown below.

| T | Key | Summary | Assignee | Reporter | P | Status | Resolution | Created | Updated |
|---|------------|---|-------------------------------|-------------------------------|---|--------|------------|--------------|--------------|
| ● | STASH-3231 | JIRA indexing does not pick up commits for a couple of hours. | Unassigned | Michael Heemskerk [Atlassian] | ↑ | CLOSED | Fixed | Mar 14, 2013 | Aug 21, 2013 |
| ● | STASH-2794 | Invalid commit command on the "How to manually merge a pull request" dialog | Michael Heemskerk [Atlassian] | Charles Thomas | ↓ | CLOSED | Fixed | Oct 26, 2012 | Nov 07, 2012 |
| ● | STASH-2777 | Repository Settings section is not showing the general settings tab as active | Jason Hinch [Atlassian] | Jason Hinch [Atlassian] | ↓ | CLOSED | Fixed | Oct 19, 2012 | Oct 22, 2012 |
| ● | STASH-2762 | SAL UpgradeTask framework doesn't work in Stash | Tim Pettersen [Atlassian] | Tim Pettersen [Atlassian] | ↑ | CLOSED | Fixed | Oct 16, 2012 | Feb 27, 2013 |
| ● | STASH-2757 | Plugins cannot set active tab in repository settings | Seb Ruiz [Atlassian] | Seb Ruiz [Atlassian] | ↓ | CLOSED | Fixed | Oct 11, 2012 | Oct 22, 2012 |

- Stash security advisory 2014-02-26

Stash security advisory 2012-09-04

This advisory discloses a security vulnerability that we have found in Stash and fixed in Stash 1.1.2.

Customers who have downloaded and installed Stash should upgrade their existing Stash installations to fix this vulnerability.

Atlassian is committed to improving product security. The vulnerability listed in this advisory has been discovered by Atlassian, unless noted otherwise. The reporter may also have requested that we do not credit them.

If you have questions or concerns regarding this advisory, please raise a support request at <http://support.atlassian.com/>.

In this advisory:

- XSS Vulnerability

XSS Vulnerability

Severity

Atlassian rates the severity level of this vulnerability as **High**, according to the scale published in [Severity Levels for Security Issues](#). The scale allows us to rank the severity as critical, high, medium or low. This is an independent assessment and you should evaluate its applicability to your own IT environment. This vulnerability is **not** of Critical severity.

Description

We have identified and fixed a persistent cross-site scripting (XSS) vulnerability that affects Stash instances, including publicly available instances (that is, Internet-facing servers). XSS vulnerabilities allow an attacker to embed their own JavaScript into a Stash page.

You can read more about XSS attacks at [cgisecurity.com](#), [The Web Application Security Consortium](#) and other places on the web.

This vulnerability affects all supported versions of Stash, and has been fixed in Stash 1.1.2. This issue can be tracked here:  **STASH-2676** - Persistent Cross Site Scripting Vulnerability CLOSED

Risk Mitigation

We strongly recommend upgrading your Stash installation to fix this vulnerability. Please see the 'Fix' section below.

Fix

Upgrade

The vulnerability and fix version are described in the 'Description' section above.

We recommend that you upgrade to the latest version of Stash, if possible. For a full description of the latest version of Stash, see the [release notes](#). You can download the latest version of Stash from the [download centre](#).

Patches are not available for this vulnerability.

Stash security advisory 2014-02-26

This advisory details a critical security vulnerability that we have found in Stash and fixed in a recent versions of Stash.

- **Customers who have downloaded and installed Stash** should upgrade their existing Stash installations to fix this vulnerability.
- **Atlassian OnDemand customers** are not affected because OnDemand does not include Stash.

The vulnerability affects all versions of Stash up to and including 2.5.3, 2.6.4, 2.7.5 and 2.8.3.

It does **not** affect versions 2.5.4, 2.6.5, 2.7.6, 2.8.4, 2.9.X, 2.10.X.

Atlassian is committed to improving product security. We [fully support the reporting of vulnerabilities](#) and we appreciate it when people work with us to identify and solve the problem.

If you have questions or concerns regarding this advisory, please raise a support request at <http://support.atlassian.com>.

User privilege escalation

Severity

Atlassian rates the severity level of this vulnerability as **critical**, according to the scale published in [Severity Levels of Security Issues](#). The scale allows us to rank the severity as critical, high, moderate or low.

This is an independent assessment and you should evaluate its applicability to your own IT environment.

Description

We have identified and fixed a vulnerability in Stash which allowed unauthenticated users to commit actions on behalf of any other authorised user. In order to exploit this vulnerability, an attacker requires access to your

Stash web interface.

The Stash server is only vulnerable if it has been configured to be a part of an Application link with [Trusted Applications authentication](#).

The vulnerability affects all supported versions of Stash up to and including 2.5.3, 2.6.4, 2.7.5 and 2.8.3. It has been fixed in the Stash security patch releases 2.5.4, 2.6.5, 2.7.6, 2.8.4. The vulnerability does not affect the Stash 2.9 and 2.10 releases. The issue is tracked in [STASH-4122 - Privilege escalation](#) CLOSED.

Risk Mitigation

If you are unable to upgrade or patch your Stash server you can do the following as a **temporary workaround**:

- Block access to your Stash server web interface from untrusted networks, such as the Internet.
- Remove any Application links that use Trusted Applications authentication and re-create them using OAuth.

Fix

This vulnerability can be fixed by upgrading Stash to one of the security patch releases or any release of Stash higher than 2.9.0. If required, there is also a patch available for this vulnerability for all supported versions of Stash. If you have any questions, please raise a support request at <http://support.atlassian.com>. We recommend upgrading.

The [Security Patch Policy](#) describes when and how we release security patches and security upgrades for our products.

Upgrading Stash

Upgrade to one of the Stash patch releases, 2.5.4, 2.6.5, 2.7.6, 2.8.4, which fixes this vulnerability, or one of the unaffected releases, 2.9 or a later version. For a full description of these releases, see the [Stash Release Notes](#).

Patches

Binary patches are not available for this advisory. You need to either install one of the patch releases or apply recommended temporary workarounds.

Learning Git

[Git Tutorials and Training](#)

[Basic Git commands](#)

Getting started

One "gotcha" when starting with Git is the way in which it pushes branches by default. On older versions of Git, pushing without arguments would push *all* branches that have the same name both locally and remotely. This can result in unexpected behaviour if you have old branches that complain when the remote branch is updated. It can even be quite dangerous if you do a force push and it reverts changes on the server. You can see the current value by running:

```
git config push.default
```

If this value is blank or 'matching', it is our recommendation that you reconfigure it to use 'upstream'.

```
git config --global push.default upstream
```

There has been some [discussion](#) around changing the default behaviour of Git.

Git .mailmap

The Git .mailmap feature is useful locally, and in Stash repositories, to map multiple commit identities to the one Stash user – this can be used to tidy up your Git histories.

The [Git documentation](#) for .mailmap has configuration details (see the "MAPPING AUTHORS" section).

Basic Git commands

Here is a list of some basic Git commands to get you going with Git.

For more detail, check out the [Atlassian Git Tutorials](#) for a visual introduction to Git commands and workflows, including examples.

| Git task | Notes | Git commands |
|-------------------------------|--|---|
| Create a new local repository | | git init |
| Check out a repository | Create a working copy of a local repository: | git clone /path/to/repository |
| | For a remote server, use: | git clone username@host:/path/to/repository |

| | | |
|--|--|---|
| Add files | Add one or more files to staging (index): | <code>git add <filename></code>
<code>git add *</code> |
| Commit | Commit changes to head (but not yet to the remote repository): | <code>git commit -m "Commit message"</code> |
| | Commit any files you've added with <code>git add</code> , and also commit any files you've changed since then: | <code>git commit -a</code> |
| Push | Send changes to the master branch of your remote repository: | <code>git push origin master</code> |
| Status | List the files you've changed and those you still need to add or commit: | <code>git status</code> |
| Connect to a remote repository | If you haven't connected your local repository to a remote server, add the server to be able to push to it: | <code>git remote add origin <server></code> |
| | List all currently configured remote repositories: | <code>git remote -v</code> |
| Branches | Create a new branch and switch to it: | <code>git checkout -b <branchname></code> |
| | Switch from one branch to another: | <code>git checkout <branchname></code> |
| | List all the branches in your repo, and also tell you what branch you're currently in: | <code>git branch</code> |
| | Delete the feature branch: | <code>git branch -d <branchname></code> |
| | Push the branch to your remote repository, so others can use it: | <code>git push origin <branchname></code> |
| | Push all branches to your remote repository: | <code>git push --all origin</code> |
| | Delete a branch on your remote repository: | <code>git push origin :<branchname></code> |
| Update from the remote repository | Fetch and merge changes on the remote server to your working directory: | <code>git pull</code> |
| | To merge a different branch into your active branch: | <code>git merge <branchname></code> |
| | View all the merge conflicts: | <code>git diff</code> |
| | View the conflicts against the base file: | <code>git diff --base <filename></code> |
| | Preview changes, before merging: | <code>git diff <sourcebranch> <targetbranch></code> |
| Tags | After you have manually resolved any conflicts, you mark the changed file: | <code>git add <filename></code> |
| | You can use tagging to mark a significant changeset, such as a release: | <code>git tag 1.0.0 <commitID></code> |

| | | |
|---------------------------|--|--|
| | CommitId is the leading characters of the changeset ID, up to 10, but must be unique. Get the ID using: | <code>git log</code> |
| | Push all tags to remote repository: | <code>git push --tags origin</code> |
| Undo local changes | If you mess up, you can replace the changes in your working tree with the last content in head:

Changes already added to the index, as well as new files, will be kept. | <code>git checkout -- <filename></code> |
| | Instead, to drop all your local changes and commits, fetch the latest history from the server and point your local master branch at it, do this: | <code>git fetch origin
git reset --hard origin/master</code> |
| Search | Search the working directory for <code>foo()</code> : | <code>git grep "foo()"</code> |

Stash FAQ

On this page:

- **Repositories**
 - Q: Does Stash support Mercurial (Hg)? What about other version control systems?
 - Q: What about Git repository management in FishEye and Crucible?
 - Q: Why did you create a new product for Git repository management? Couldn't you build this into FishEye?
 - Q: Does FishEye require Stash? Does Stash require FishEye? Can they be used together?
 - Q: I'm getting a "broken pipe" error when pushing my commits.
- **Integration**
 - Q: Does Stash work with JIRA? If so, what version of JIRA do I need to run Stash?
 - Q: Will Stash integrate with any other Atlassian Tools? Crowd? Bitbucket? SourceTree?
 - Q: Will Stash be available for Atlassian Cloud?
- **Licensing**
 - Q: Does my Stash license have to match the number of users in my external directory (LDAP, Active Directory, Crowd or JIRA)?
 - Q: The number of users in my instance has exceeded my license count. Will Stash still work properly?
- **Data recovery and backups**
 - Q: Can I restore the .tar file created by the backup client into a database that is different from my original one (i.e. Oracle -> MySQL, etc.)?
 - Q: I forgot the user/password for my old database schema. How will I perform the restore? How does it work?
 - Q: What is the difference between the parameter pairs "stash.user & stash.password" and "jdbc.user & jdbc.password"?
 - Q: I backed up Stash of a particular version. Can I restore Stash to a newer release version?

Repositories

Q: Does Stash support Mercurial (Hg)? What about other version control systems?

A: Currently Stash does not support Mercurial. We will be gauging demand for Mercurial support as we move forward -  STASH-2469 - Include Mercurial (Hg) support in Stash [OPEN](#)

Q: What about Git repository management in FishEye and Crucible?

A: *Internally managed* Git repositories were deprecated in FishEye and Crucible 2.8, and support for these was removed for the FishEye and Crucible 3.2 releases. We encourage those interested in Git repository management to check out Stash.

FishEye and Crucible will continue to deliver new features and enhancements to help users browse, search, review and visualize across different Version Control Systems *including Git*, Subversion, Mercurial, Perforce and CVS.

Q: Why did you create a new product for Git repository management? Couldn't you build this into FishEye?

A: In FishEye 2.7 we added basic capabilities to host and manage Git repositories within FishEye. However, as we were planning future releases, we realized that the architecture of FishEye, built to index, browse and search across various SCMs, was not adequate for a DVCS repository management tool.

Therefore we have made the decision to build a new product, with a clear focus: hosting and managing Git repositories. Instead of a "Jack of all trades", we will have two products that are focused on 2 very different tasks:

1. Stash – Host, manage and collaborate on Git repositories
2. FishEye – Track, search and browse Subversion, Perforce, Git, Mercurial and CVS repositories in one place.

Q: Does FishEye require Stash? Does Stash require FishEye? Can they be used together?

A: FishEye and Stash are two separate standalone products that do not require each other.

If you are using multiple source code management systems (SCM) at your organization it makes sense to use both FishEye and Stash. While you are managing your Git repositories with Stash, you can use FishEye to browse, search and reference code from other SCMs including Subversion.

Also, if you are using Git, Stash will provide your Git repository management, and FishEye will be a central place to keep track of changes and search for code across your repositories.

Q: I'm getting a "broken pipe" error when pushing my commits.

A: This error occurs when the amount of data you're trying to push in one go exceeds Git's http post buffer. Just run the following command to increase it to 500MB.

```
git config http.postBuffer 524288000
```

See [Git push fails with 'fatal: The remote end hung up unexpectedly'](#).

Integration

Q: Does Stash work with JIRA? If so, what version of JIRA do I need to run Stash?

A: Stash works with JIRA 4.3+. However, you will require the latest version of the JIRA/FishEye plugin to view commits in JIRA. See our documentation on [JIRA integration](#).

Q: Will Stash integrate with any other Atlassian Tools? Crowd? Bitbucket? SourceTree?

A: Stash currently integrates with the JIRA issues tracker, SourceTree DVCS Mac client and Crowd user management solution. You can also connect to Stash via Bamboo to run your builds and deployments and we are planning even tighter integrations in the future.

Q: Will Stash be available for Atlassian Cloud?

A: Stash will not be available in Atlassian Cloud. If you are looking for a distributed version control solution to use with Atlassian Cloud, we recommend using [Bitbucket](#), our cloud-based Git and Mercurial source code hosting solution. Bitbucket connects to Atlassian Cloud via the [JIRA DVCS connector](#).

Licensing

Q: Does my Stash license have to match the number of users in my external directory (LDAP, Active Directory, Crowd or JIRA)?

A: No. You can control which users in your external directory have access to Stash, so that the license limit is not exceeded. A user is by [definition](#) any account that has permission to log into the Stash application. If you synchronise Stash with an external user directory, you can grant access to Stash to a subset of users, so as to stay below your license limit. The [Global permissions](#) page explains in detail how to manage login rights for users and groups in Stash.

Q: The number of users in my instance has exceeded my license count. Will Stash still work properly?

A: As stated in the [Global permissions](#) document, any user assigned "Stash User" permission or higher, granted to the individual or via a group, will count towards the license limit. Stash will not allow you to grant the "Stash User" permission if this will exceed the license limit while manually adding users using Stash UI. However, if you happen to exceed the license limit by connecting your Stash instance to a User Directory that contains more users than your license allows you to have, Stash will display a banner with the content below:

 You have more users than your license allows.

Users will not be able to push commits to repositories until you restrict the number of active users to match your license or you upgrade your current license.

To fix that bear in mind that users don't have to be removed from the database in order to reduce their license count. You merely have to make sure that they no longer have access to Stash via the "Stash User" permission through individual or group assignments.

Data recovery and backups

Q: Can I restore the .tar file created by the backup client into a database that is different from my original one (i.e. Oracle -> MySQL, etc.)?

A: Yes you can, as long as you specify all the `jdbc` parameters (`jdbc.override`, `jdbc.driver`, etc.) when running the restore. Please read [Restoring Stash into a newly created DB](#) for more details.

Q: I forgot the user/password for my old database schema. How will I perform the restore? How does it work?

A: As described in [Restoring Stash into a newly created DB](#), the restore client will only restore into an empty home directory and an **empty database**. The new database should be configured following the instructions in [Connecting Stash to an external database](#) and its sub-page that corresponds to your database type. If you want to use a different type of database or a different user/password, you just need to specify all the `jdbc` parameters (`jdbc.override`, `jdbc.driver`, etc) when running the restore.

Q: What is the difference between the parameter pairs "stash.user & stash.password" and " jdbc.user & jdbc.password"?

A: `stash.user` and `stash.password` hold the credentials for a Stash sys admin user. They are only used during the **backup** procedure so that the backup client can lock Stash and instruct Stash to perform the database-agnostic backup. The backup client does not need database credentials because the Stash system performs the database backup.

`jdbc.user` and `jdbc.password` are only used during the **restore** procedure when `jdbc.override` is set to true. They are used to connect to the newly-installed database.

Q: I backed up Stash of a particular version. Can I restore Stash to a newer release version?

A: No. You need to use the same Stash binary as the one originally used to back up your instance. Note that using an older Stash binary will result in an error – downgrades are not possible. See [Using the Stash Backup Client](#) for details on the backup/restore procedure.

Once you have restored Stash, you can upgrade to a newer version of Stash following the instructions in the [Stash upgrade guide](#).

How do I change the external database password

You can change the password the Stash uses to connect to an external database, however you don't do this from the Stash Administration area – you must follow the procedure described below.

Related pages:

- [Connecting Stash to an external database](#)

To change the password that Stash uses when connecting to an external database:

1. Stop Stash. See [Starting and stopping Stash](#).
2. Get your database administrator to change the password on your database.
3. Go to your [Stash home directory](#).

Edit the `stash-config.properties` file to change the line that looks like:

```
jdbc.password=MY_PASSWORD
```

replacing `MY_PASSWORD` with your new database password.

4. Restart Stash. See [Starting and stopping Stash](#).

Stash home directory

What is the Stash home directory?

 The Stash home directory is created automatically by the Stash installer – see [Getting started](#). The

information on this page only applies if you are manually installing or upgrading Stash.

The Stash home directory is where your Stash data is stored. The home directory location is defined either by the `STASH_HOME` environment variable, or in the `STASH_HOME` line of:

- Windows: `<Stash installation directory>\bin\setenv.bat`
Note that for Windows services created using the Stash installer, the `STASH_HOME` directory location is configured as a Tomcat Service JVM option. To change it see [Change STASH_HOME when installed as a Windows service](#).
- Linux and Mac: `<Stash installation directory>/bin/setenv.sh`

 You *should not* locate your Stash home directory inside the `<Stash installation directory>` — they should be entirely separate locations. If you do put the home directory in the `<Stash installation directory>` it will be overwritten, and lost, when Stash gets upgraded. And by the way, you'll need separate Stash home directories if you want to run multiple instances of Stash.

 Where possible, you should choose a location for your Stash home directory that will *never* need to be moved. Some home contents are location-sensitive, so moving the home directory may corrupt them. Stash attempts to update contents when it detects that the home directory has moved, but the safest approach is to avoid the issue altogether by leaving the home directory in the same location.

What does the Stash home directory contain?

Your Stash home directory contains the following directories and files:

| Path | Description |
|-------------------------|---|
| caches | Contains cache and index files. It should be safe for these files to be deleted between application restarts; however, these files must not be modified or deleted while Stash is running. |
| config | Contains application configuration. |
| data | Contains the Git repositories, project avatars, and the embedded HSQL database if an external database is not configured. |
| export | Contains dump files produced during database migrations. |
| lib | As of Stash 2.1, can contain third-party jars such as the MySQL JDBC driver. |
| lib/native | As of Stash 2.1, can contain <i>native libraries</i> , such as Tomcat's APR-based native library. |
| log | Contains log files for Stash. |
| plugins | Contains plugin related data (such as externally uploaded plugins) for Stash. |
| tmp | Contains temporary files created by the system. Its contents can safely be deleted when Stash is <i>not running</i> . |
| stash-config.properties | Allows configuring various aspects of how Stash behaves, such as its database connection pool size and the location of the Git binary to use. This file will be created automatically during a database migration. It can be created manually otherwise. See Stash config properties for further information. |

Setting the Stash home directory

Note that the Stash home directory is created automatically by the Stash installer – see [Getting started](#).

Only when you are [installing Stash from an archive file](#) will you need to set the value of `STASH_HOME` yourself, as described in this section.

▼ [Click here if setting STASH_HOME on Linux or Mac...](#)

The Stash home directory is where your Stash data is stored.

Create your Stash home directory (without spaces in the name), and then tell Stash where you created it by editing the `<Stash installation directory>/bin/setenv.sh` file – uncomment the `STASH_HOME` line and add the absolute path to your home directory. Here's an example of what that could look like when you're done:

```

1  #
2  # One way to set the STASH HOME path is here via this variable. Simply uncomment it and set a valid path
3  # /stash/home. You can of course set it outside in the command terminal; that will also work.
4  #
5  STASH_HOME="/Users/spittet/stash-home"
6  #
7  #
8  # Occasionally Atlassian Support may recommend that you set some specific JVM arguments. You can use the
9  # below to do that.
10 #

```

▼ [Click here if setting STASH_HOME on Windows...](#)

The Stash home directory is where your Stash data is stored.

Create your Stash home directory, and then tell Stash where you created it by setting a `STASH_HOME` environment variable, as follows.

For Windows 7:

1. Go to **Start**, search for "sys env" and choose **Edit the system environment variables**.
2. Click **Environment Variables**, and then **New** under 'System variables'.
3. Enter "STASH_HOME" as the **Variable name**, and the absolute path to your Stash home directory as the **Variable value**. Don't use a trailing backslash.

There are a few things to know about setting up the Stash home directory on Windows that will make life easier:

- You *should not* locate your Stash home directory inside the `<Stash installation directory>` — they should be entirely separate locations. If you do put the home directory in the `<Stash installation directory>` it will be overwritten, and lost, when Stash gets upgraded. And, by the way, you can't use the same Stash home directory for multiple instances of Stash.
- Keep the path length to the Stash home directory as short as possible. See [Pull request merges can fail when Stash is hosted on Windows](#) for an explanation.
- Don't use spaces in the path to the Stash home directory.

Securing the Stash home directory

The internal database files, the migration dump files and `stash-config.properties` all contain information that may be considered secret (server settings, salted and hashed user passwords, database passwords, etc).

For production use, we strongly recommend that you secure this directory against unauthorised access.

We recommend the following precautions:

- Assign a separate restricted user account on the machine for running Stash (not a root/administrator user)
 - If you wish to run Stash on port 80, use a separate http front end as described in [Integrating Stash with Apache HTTP Server](#) (do not run as root/Administrator if security of the home directory is important to you)
- Ensure that only the user running Stash can access the Stash home directory, and that this user has read, write and execute permissions, by setting file system permissions appropriately for your operating system.

About the repositories

As noted above, `data` contains the Git repositories being managed by Stash, where "managed by Stash" are the operative words. The repositories are for *Stash* to interact with, and they are configured and managed accordingly. They are *not* a mechanism for configuring Stash behaviour. We *strongly* recommend that customers never modify them, nor interact with them directly. They are *intentionally* structured in a way which does not lend itself well to direct interaction.

Being Git repositories, there are certainly standard aspects to how the repositories on disk are stored and how they function. However, the exact way they are configured *can and does* change between Stash releases. Stash makes *no effort* to preserve unexpected configuration changes which have been applied by customers, and such changes may cause failures at runtime or during upgrades. If there is an aspect of Stash's behaviour you wish to configure, please open a feature request on jira.atlassian.com rather than trying to modify the repositories directly.

! Repositories are *location sensitive*. Moving your Stash home directory will result in the system being locked (briefly) on startup while Stash updates the repositories on disk. Assuming the updates are applied successfully, the system will then unlock itself for normal usage.

Where possible, please choose a Stash home location which will not need to be changed later.

Raising a request with Atlassian Support

If you encounter any problems when setting up or using Stash, please let us know — we're here to help!

You may want to search the following first:

- the [Atlassian Answers site](#) (the Stash forum), where Atlassian staff and Stash users can answer your questions.
- the [Stash Knowledge Base](#).

If you've found a bug in Stash, or want to request a feature or improvement, raise a ticket in the Stash project of our [public issue tracker](#). Try searching for similar issues - voting for an existing issue is quicker, and avoids duplicates.

If you still need assistance, please raise a support request, either from within Stash or on the Atlassian Support site, as described in the following sections.

Providing as much information as possible about your Stash installation with your initial request will help our Support Engineers to give you a faster and more complete response.

On this page:

- [Raising a Support Request from within Stash](#)
- [Raising a Support request yourself at Atlassian Support](#)
- [Information you should provide](#)

Raising a Support Request from within Stash

This method depends on having a [mail server configured for Stash](#) that supports large zip file attachments.

1. Log in to Stash (as a [System Administrator](#)) and go to the [admin area](#).
2. Click **Atlassian Support Tools** (under 'Support') then **Support Request**.
3. Provide as much information as possible in the Description, including steps to replicate the problem, and any error messages that are appearing on the console or in the logs. For performance issues, please include [profiling logs](#). See the section below about [information you should provide](#).
4. Click **Send**.

This will produce a zip file containing the information categories selected from the list and will email this to Atlassian Support. You will receive an email advising you of details of the Support Request that was automatically created, and you will receive emailed updates about progress on your issue. You can also see the status of your request directly by visiting the [Atlassian Support System](#).

Raising a Support request yourself at Atlassian Support

1. Log in to Stash (as a [System Administrator](#)) and go to the [admin](#) area.
2. Click **Atlassian Support Tools** (under 'Support') then **Support Zip**.
3. Select information categories to include in the zip file.
4. Click **Create**.

The zip file is created in the [home directory](#) of the Stash server, for example <STASH_HOME>\export\Stash_support_2013-11-17-20-49-18.zip.

When you now go to [Atlassian Support](#) and create a Support Request, you can attach the Support Zip file to the request.

Please provide as much information as possible in the request, including steps to replicate the problem, and any error messages that are appearing on the console or in the [logs](#). For performance issues, please include [profiling logs](#). See the section below about [information you should provide](#).

Information you should provide

In addition to the logs and configuration information that you can include in the Support Request zip file, the following information can help to give you a faster response:

Environment details

- Stash version
- Java version (for example OpenJDK 1.7.0 JRE)
- Git and Perl versions
- Operating system (for example, Windows 7, Mac OS X 10.6.8)
- Database type (for example, MySQL) and version
- Browsers and versions
- Network topology - is Stash running behind a reverse proxy? Is that secured using HTTPS (SSL)?

Configuration

- Java settings, including JVM_MINIMUM_MEMORY, JVM_MAXIMUM_MEMORY

Logs

You may need to adjust the logging level, or enable profiling in Stash, in order to get more detailed logs. See [Stash debug logging](#).

- Debug logs – Stash debug logs can be found in <STASH_HOME>/log.
- Profiling logs – Stash profiling logs can help with analyzing performance issues and can be found in <STASH_HOME>/log.

Performance factors

- Number of concurrent Git clones
- Number of users
- The size of the .git directory
- CPU spec, number of cores, whether hyperthreading is enabled
- RAM and cache sizes

Integrations

- Other Atlassian applications (and their versions)
- Which build servers are integrated with Stash, if any?
- Are Application Links configured?

Support policies

Welcome to the support policies index page. Here, you'll find information about how Atlassian Support can help you and how to get in touch with our helpful support engineers. Please choose the relevant page below to find out more.

- Bug fixing policy
- New features policy
- Security Bugfix Policy

To request support from Atlassian, please raise a support issue in our online support system. To do this, visit [support.atlassian.com](#), log in (creating an account if need be) and create an issue under Stash. Our friendly support engineers will get right back to you with an answer.

Bug fixing policy

Summary

- Atlassian Support will help with workarounds and bug reporting.
- Critical bugs will generally be fixed in the next maintenance release.
- Non critical bugs will be scheduled according to a variety of considerations.

Raising a Bug Report

Atlassian Support is eager and happy to help verify bugs — we take pride in it! Please open a support request in our [support system](#) providing as much information as possible about how to replicate the problem you are experiencing. We will replicate the bug to verify, then lodge the report for you. We'll also try to construct workarounds if they're possible.

Customers and plugin developers are also welcome to open bug reports on our issue tracking systems directly. Use the appropriate project on <http://jira.atlassian.com> to report bugs for Atlassian products.

When raising a new bug, you should rate the priority of a bug according to our [JIRA usage guidelines](#). Customers [should watch](#) a filed bug in order to receive e-mail notification when a "Fix Version" is scheduled for release.

How Atlassian Approaches Bug Fixing

Maintenance (bug fix) releases come out more frequently than major releases and attempt to target the most critical bugs affecting our customers. The notation for a maintenance release is the final number in the version (ie the 1 in 3.0.1).

If a bug is critical (production application down or major malfunction causing business revenue loss or high numbers of staff unable to perform their normal functions) then it will be fixed in the next maintenance release provided that:

- The fix is technically feasible (i.e. it doesn't require a major architectural change).
- It does not impact the quality or integrity of a product.

For non-critical bugs, the developer assigned to fixing bugs prioritises the non-critical bug according to these factors:

- How many of our supported configurations are affected by the problem.
- Whether there is an effective workaround or patch.
- How difficult the issue is to fix.
- Whether many bugs in one area can be fixed at one time.

The developers responsible for bug fixing also monitor comments on existing bugs and new bugs submitted in JIRA, so you can provide feedback in this way. We give high priority consideration to [security issues](#).

When considering the priority of a non-critical bug we try to determine a 'value' score for a bug which takes into account the severity of the bug from the customer's perspective, how prevalent the bug is and whether roadmap features may render the bug obsolete. We combine this with a complexity score (i.e. how difficult the bug is). These two dimensions are used when developers self serve from the bug pile.

See [Atlassian Support Offerings](#) for more support-related information.

New features policy

Summary

- We encourage and display customer comments and votes openly in our issue tracking system, <http://jira.atlassian.com>.
- We do not publish roadmaps.
- Product Managers review our most popular voted issues on a regular basis.
- We schedule features based on a variety of factors.
- Our [Atlassian Bug Fixing Policy](#) is distinct from this process.
- Atlassian provides consistent updates on the top 20 issues.

How to Track what Features are Being Implemented

When a new feature or improvement is scheduled, the 'fix-for' version will be indicated in the JIRA issue. This happens for the upcoming release only. We maintain roadmaps for more distant releases internally, but because these roadmaps are often pre-empted by changing customer demands, we do not publish them.

How Atlassian Chooses What to Implement

In every major release we *aim* to implement highly requested features, but it is not the only determining factor. Other factors include:

- **Customer contact:** We get the chance to meet customers and hear their successes and challenges at Atlassian Summit, Atlassian Unite, developer conferences, and road shows.
- **Customer interviews:** All product managers at Atlassian do customer interviews. Our interviews are not simply to capture a list of features, but to understand our customers' goals and plans.
- **Community forums:** There are large volumes of posts on [answers](#), of votes and comments on [jira.atlassian.com](#), and of conversations on community forums like groups on LinkedIn.
- **Customer Support:** Our support team provides clear insights into the issues that are challenging for customers, and which are generating the most calls to support
- **Atlassian Experts:** Our [Experts](#) provide insights into real-world customer deployments, especially for customers at scale.
- **Evaluator Feedback:** When someone new tries our products, we want to know what they liked and disliked and often reach out to them for more detail.
- **In product feedback:** The [JIRA Issue Collectors](#) that we embed our products for evaluators and our Early Access Program give us a constant pulse on how users are experiencing our product.
- **Usage data:** Are customers using the features we have developed?
- **Product strategy:** Our long-term strategic vision for the product.
- Please read our post on [Atlassian Answers](#) for a more detailed explanation.

How to Contribute to Feature Development

Influencing Atlassian's release cycle

We encourage our customers to vote on issues that have been raised in our public JIRA instance, <http://jira.atlassian.com>. Please find out if your request already exists - if it does, vote for it. If you do not find it you may wish to create a new one.

Extending Atlassian Products

Atlassian products have powerful and flexible extension APIs. If you would like to see a particular feature implemented, it may be possible to develop the feature as a plugin. Documentation regarding the [plugin APIs](#) is available. Advice on extending either product may be available on the user mailing-lists, or at [Atlassian Answers](#).

If you require significant customisations, you may wish to get in touch with our [partners](#). They specialise in extending Atlassian products and can do this work for you. If you are interested, please [contact us](#).

Further reading

See [Atlassian Support Offerings](#) for more support-related information.

Security Bugfix Policy

See [Security @ Atlassian](#) for more information on our security bugfix policy.

Building Stash from source

This page has moved!

To our Development Hub at <https://developer.atlassian.com/display/STASHDEV/Building+from+Source+Code>.

But you really wanted to [build a plugin anyway](#), right?

Contributing to the Stash documentation

Would you like to share your Stash hints, tips and techniques with us and with other Stash users? We welcome your contributions.

Blogging your technical tips and guides

Have you written a blog post describing a specific configuration of Stash or a neat trick that you have discovered? Let us know, and we will link to your blog from our documentation.

Contributing documentation in other languages

Have you written a guide to Stash in a language other than English, or translated one of our guides? Let us know, and we will link to your guide from our documentation.

On this page:

- [Blogging your technical tips and guides](#)
- [Contributing documentation in other languages](#)
- [Updating the documentation itself](#)
 - [Getting permission to update the documentation](#)
 - [Our style guide](#)
 - [How we manage community updates](#)

Updating the documentation itself

Have you found a mistake in the documentation, or do you have a small addition that would be so easy to add yourself rather than asking us to do it? You can update the documentation page directly

Getting permission to update the documentation

Please submit the [Atlassian Contributor License Agreement](#).

Our style guide

Please read our short [guidelines for authors](#).

How we manage community updates

Here is a quick guide to how we manage community contributions to our documentation and the copyright that applies to the documentation:

- **Monitoring by technical writers.** The Atlassian technical writers monitor the updates to the documentation spaces, using RSS feeds and watching the spaces. If someone makes an update that needs some attention from us, we will make the necessary changes.
- **Wiki permissions.** We use wiki permissions to determine who can edit the documentation spaces. We ask people to sign the [Atlassian Contributor License Agreement](#) (ACLA) and submit it to us. That allows us to verify that the applicant is a real person. Then we give them permission to update the documentation.
- **Copyright.** The Atlassian documentation is published under a Creative Commons CC BY license. Specifically, we use a [Creative Commons Attribution 2.5 Australia License](#). This means that anyone can copy, distribute and adapt our documentation provided they acknowledge the source of the documentation. The CC BY license is shown in the footer of every page, so that anyone who contributes to our documentation knows that their contribution falls under the same copyright.

Collecting analytics for Stash

We are continuously working to make Stash better. Data about how you use Stash helps us do that. We have updated our Privacy Policy so that we may collect usage data automatically unless you disable collection. The data we collect includes information about the systems on which your installation of Stash is operating, the features you use in Stash, and your use of common IT terminology within the product. For more details, see our [Privacy Policy](#), in particular the 'Analytics Information from Downloadable Products' section.

See also our [End User Agreement](#).

How to change data collection settings?

You can opt in to, or out of, data collection at any time. A Stash admin can change the data collection settings by going to **Analytics** (under 'Settings') in the Stash admin area.

How is data collected?

We use the Atlassian Analytics plugin to collect event data in Stash. Analytics logs are stored locally and then periodically uploaded to a secure location.
